

# Economic impacts of certain Framework 53 measures

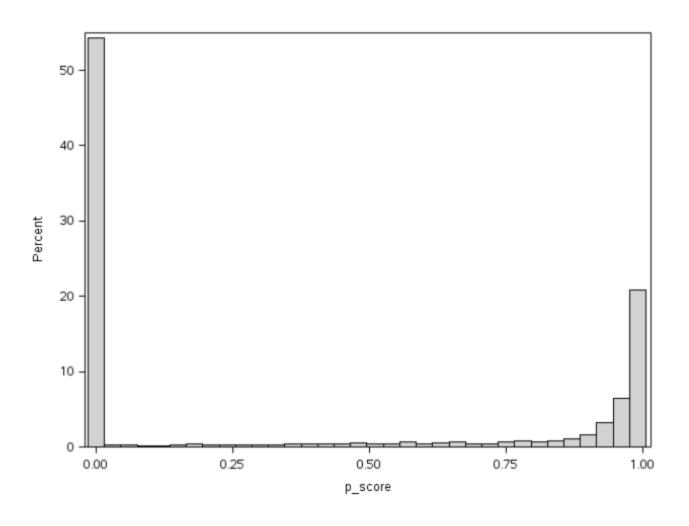

Chad Demarest Economist NEFSC November 18, 2014

- Overview
- Results
- Discussion

#### **Quota Change Model**

# Model assumptions:

- Stock conditions, fishing practices and harvest technologies existing during the data period are representative;
- trips are repeatable;
- demand for groundfish is constant, noting that fish prices do vary between the reference population and the sample population but this variability is consistent with the underlying price/quantity relationship observed during the reference period;
- quota opportunity costs and operating costs are both constant; and,
- ACE flows seamlessly from lesser to lessee such that fishery-wide caps can be met without leaving ACE for constraining stocks stranded.

All estimates based on FY 2010-2013 DMIS data

Values reported in millions, 2014 dollars

^ FY2011 revenues from GB haddock were predicted at \$25.2 million. Realized revenues from GB haddock were \$11.7 million

Gross groundfish revenues less GB haddock were predicted at \$82.7mil and realized \$76.7mil \* Reference pool = FY 2010

\*\* Refence pool = FY 2010-11 (last six months FY10, first six months cod interim measures FY11)

\*\*\* Reference pool = FY2012

\*\*\*\* Reference pool = FY2013

^^ Based on updated GOM haddock ACL and GOM

^^^Linear projection from Oct 23, 2014

## Results

- Losses on the order of 5-10% aggregate gross revenues
- Higher costs, lower profit margins
- Inshore GOM ports and small (<50ft) vessels most adversely affected—losses from 30-70+%

### **Discussion**

- Losses to small, inshore GOM vessels greater than those seen in tables – likely >50%
- Closure scenarios predicted to increase aggregate gross revenues
  - Larger vessels gain, smaller vessels lose
- Zero retention scenarios predicted to increase aggregate gross revenues relative to non-ZR analogs
  - Driven by discard mortality rate assumptions
  - True and nominal discards likely to differ due to observer effects
