“This information is distributed solely for the purposes of pre-dissemination peer review. It has not been formally disseminated by NOAA and does not represent any final agency determination.”

1 2022 SURVEY BIOMASS ESTIMATES

Table 1.1. Summary of 2022 Habcam estimates for scallops larger than 40 mm shell height using the combined data from NEFSC and CFF. SARC 65 SH-MW equations were used to estimate meat weights for all SAMS areas. MeanWt is estimated using BmsMT/NumMill. #PerM² is estimated using NumMill/Area. The target annotation rate is 1:50 for NEFSC and 1:100 for CFF for 2022. However, 1:25 was conducted by accident in some areas for the NEFSC Habcam survey. No scallops were found in CL1-South from Habcam survey this year.

2 FIGURES OF SURVEY COVERAGE

The 2022 NEFSC Habcam/Dredge survey took place in Mid-Atlantic from May 14th to 20th and in Georges Bank from May 21st to June 13th. The center completed 1,124 nm of Habcam tracks in Mid-Atlantic and 600 nm in Georges Bank, collected over 5.3 million image pairs, and manually annotated 123,568 images. Of all the images with scallops annotated, 68% (5684/8381) were QAQCed. The overall QAQC rate is 7% (8381/123568). A new Mako camera system with a higher resolution was used for the NEFSC Habcam survey this year. As a result, the image pixels increase from 1360*1024 to 1936*1216. Forty-four geostatistical models were constructed to produce the spatial count and biomass estimates of scallops for Georges Bank and Mid-Atlantic for 2022.

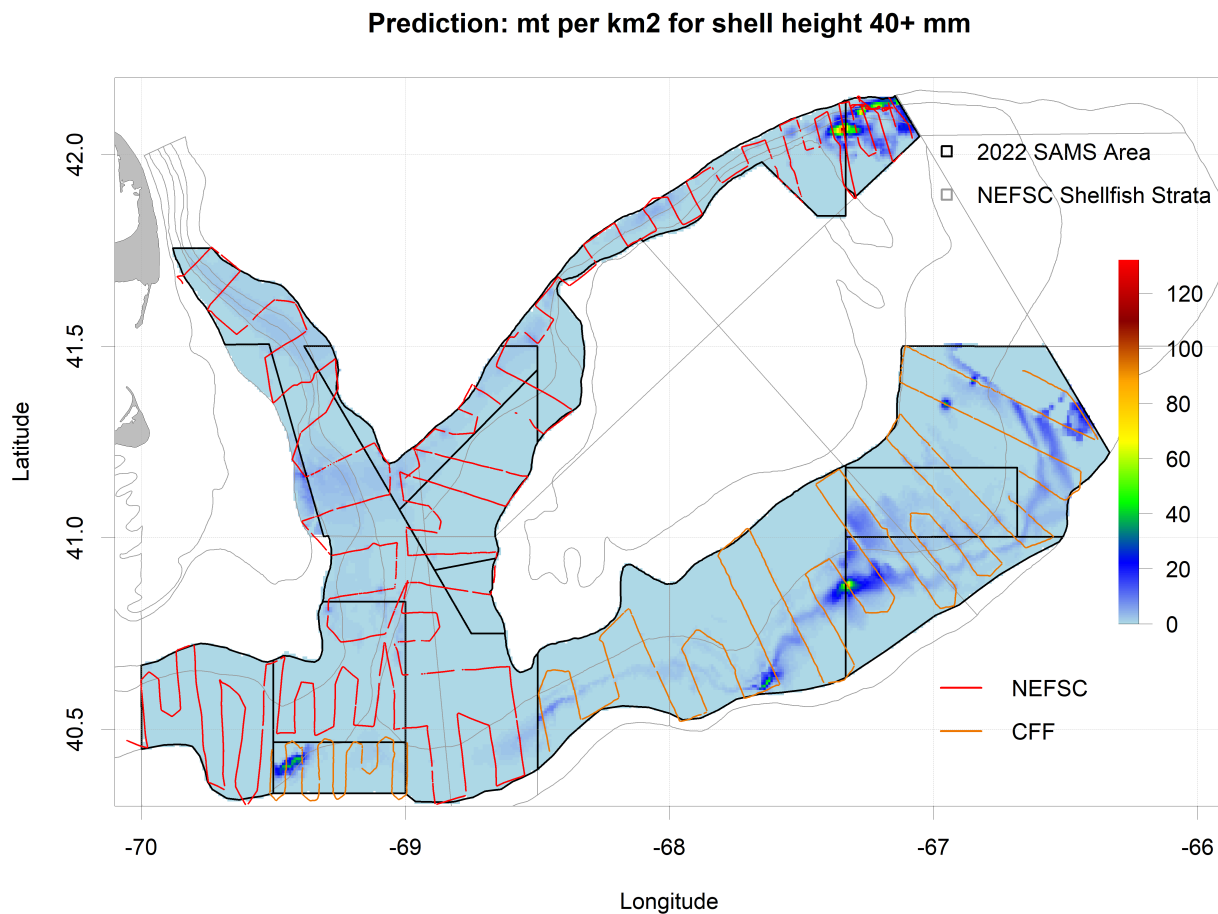

Figure 2.1. The 2022 Habcam survey tracks conducted by NEFSC and CFF, along with 2022 Habcam biomass estimates for 40+ mm scallops for Georges Bank.

Prediction: mt per km2 for shell height 40+ mm

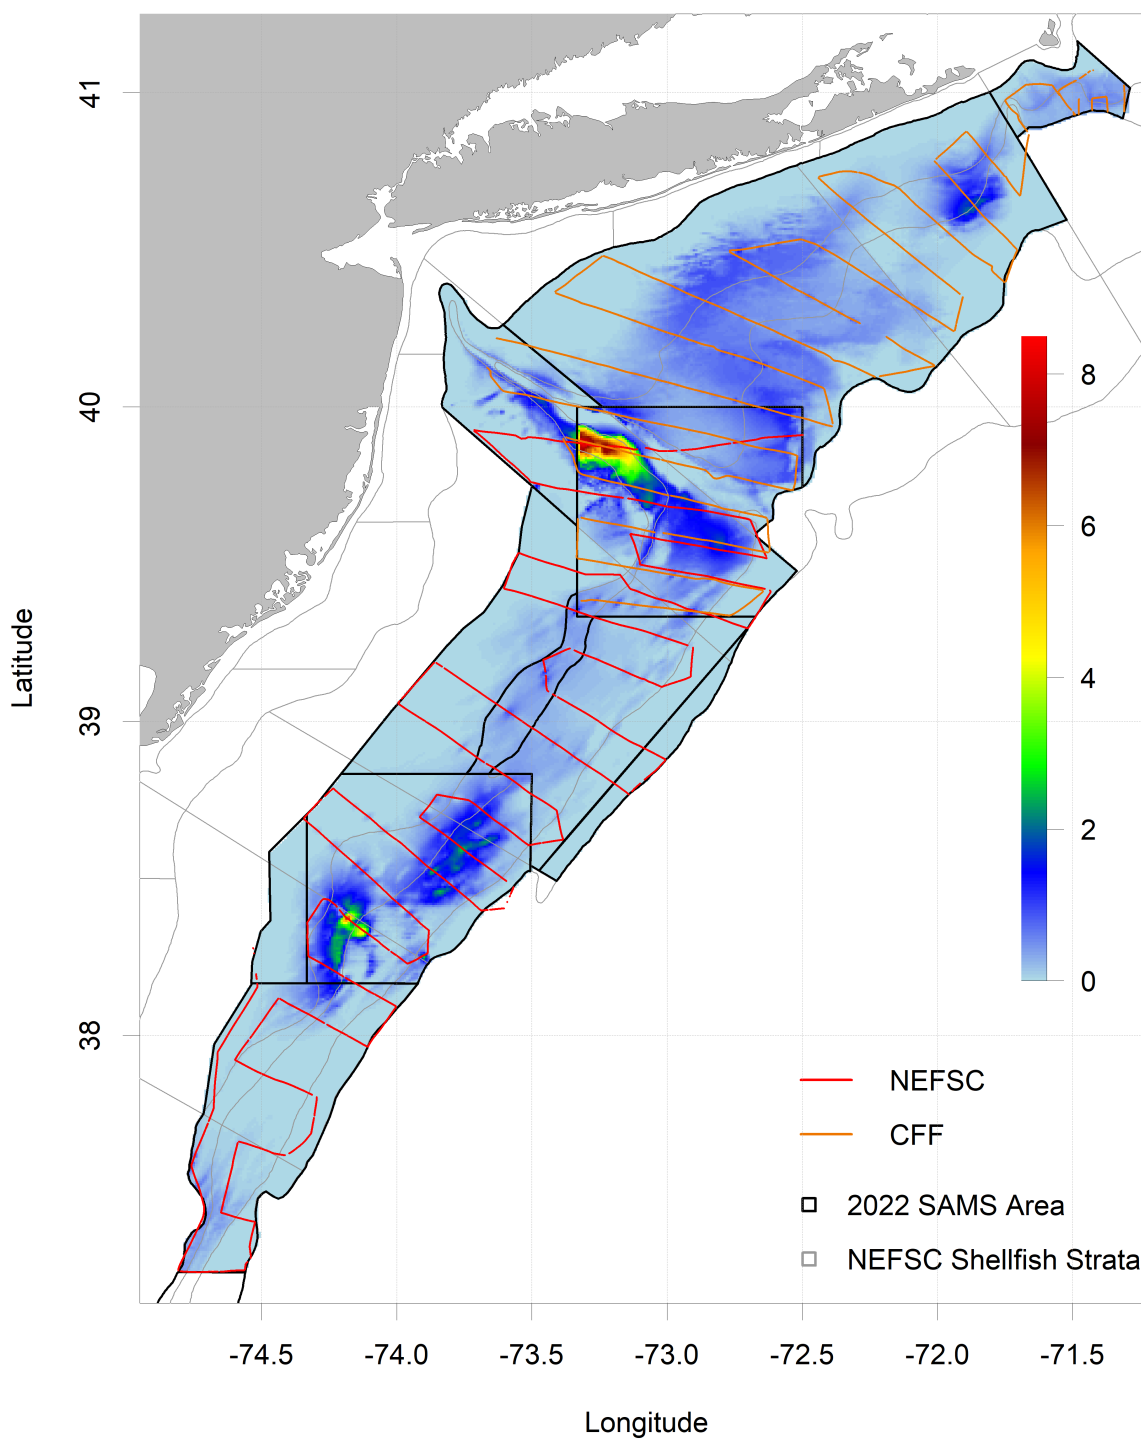

Figure 2.2. The 2022 Habcam survey tracks conducted by NEFSC and CFF, along with 2022 Habcam biomass estimates for 40+ mm scallops for Mid-Atlantic.

Prediction: mt per km2 for shell height 40+ mm
Observation: # per m2 for shell height <35 mm

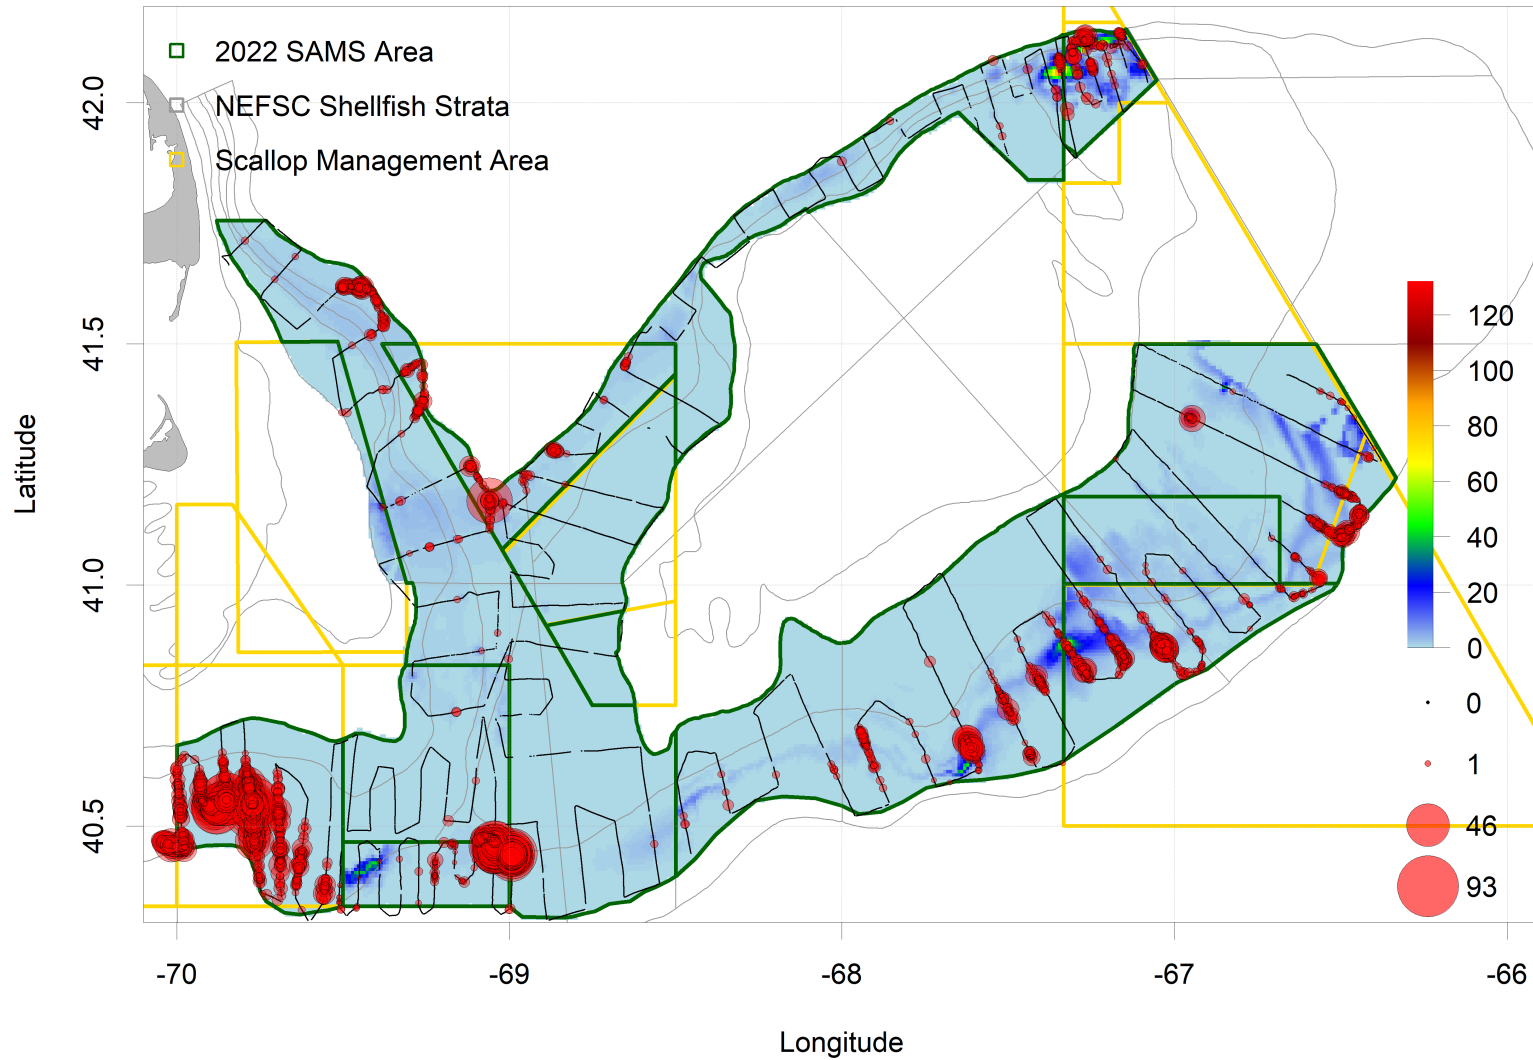

Figure 2.3. The number of <35 mm scallops observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam biomass estimates for 40+ mm scallops for Georges Bank.

Prediction: mt per km2 for shell height 40+ mm
Observation: # per m2 for shell height 35-75 mm

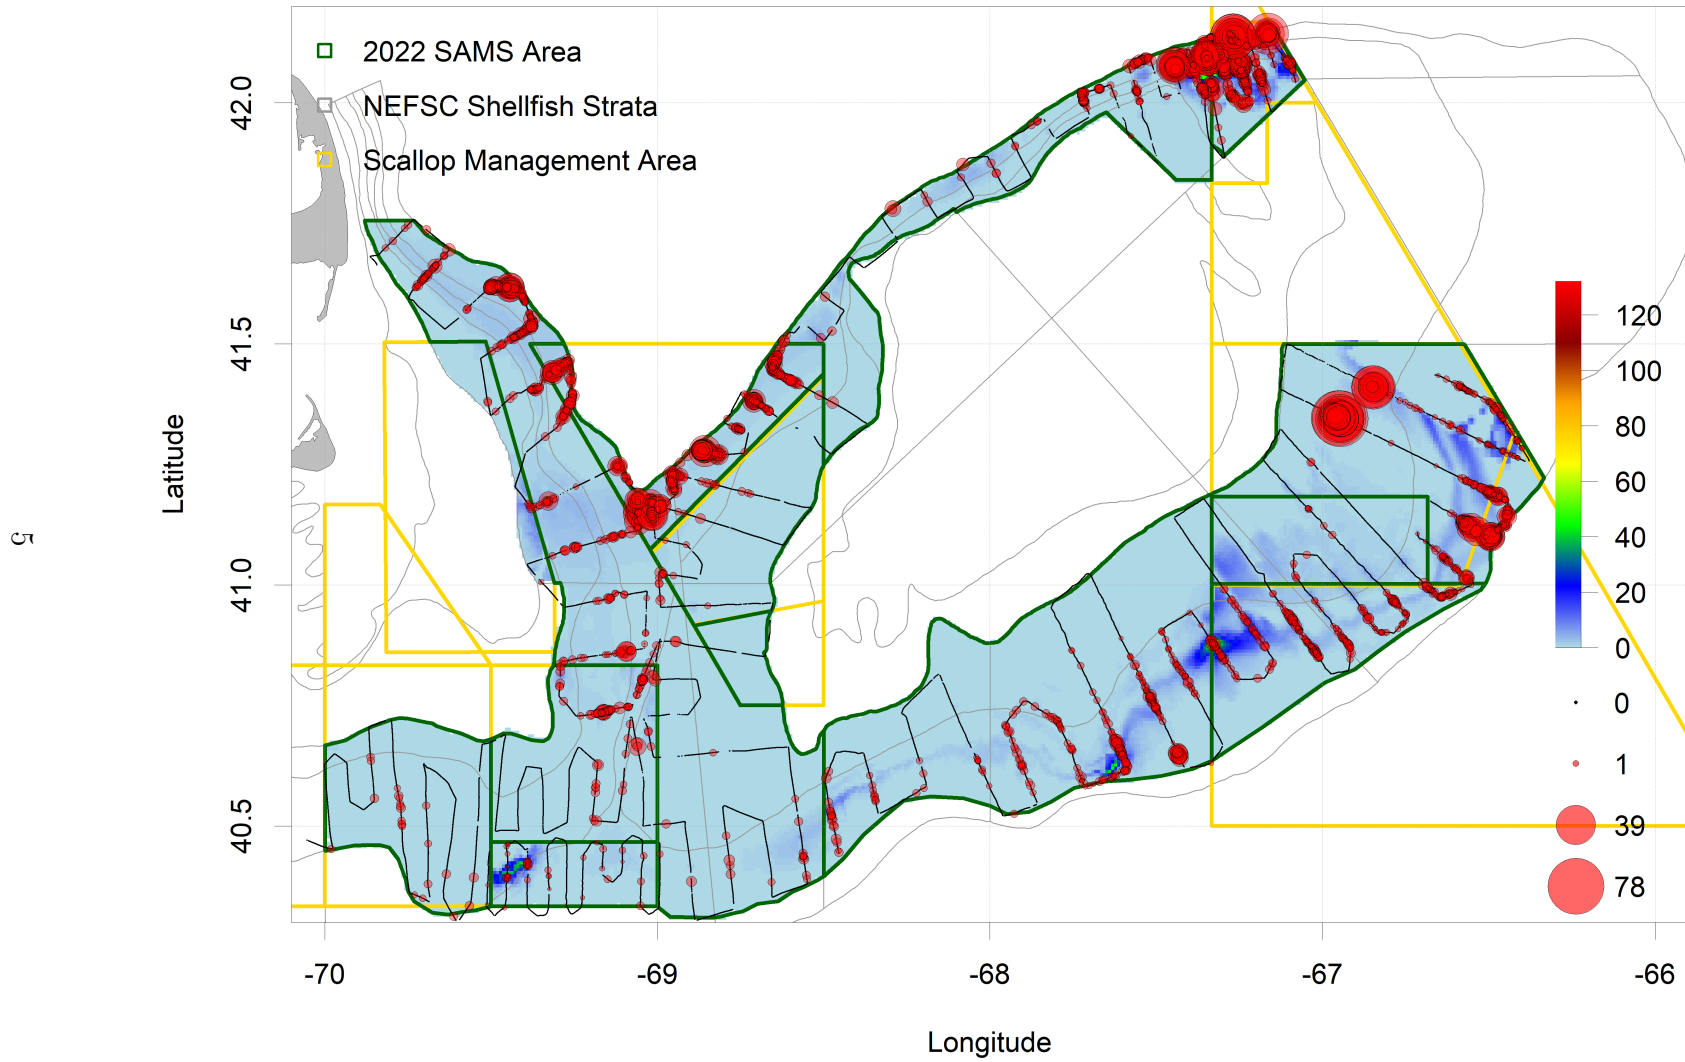

Figure 2.4. The number of 35-75 mm scallops observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam biomass estimates for 40+ mm scallops for Georges Bank.

Prediction: mt per km2 for shell height 40+ mm
Observation: # per m2 for shell height >75 mm

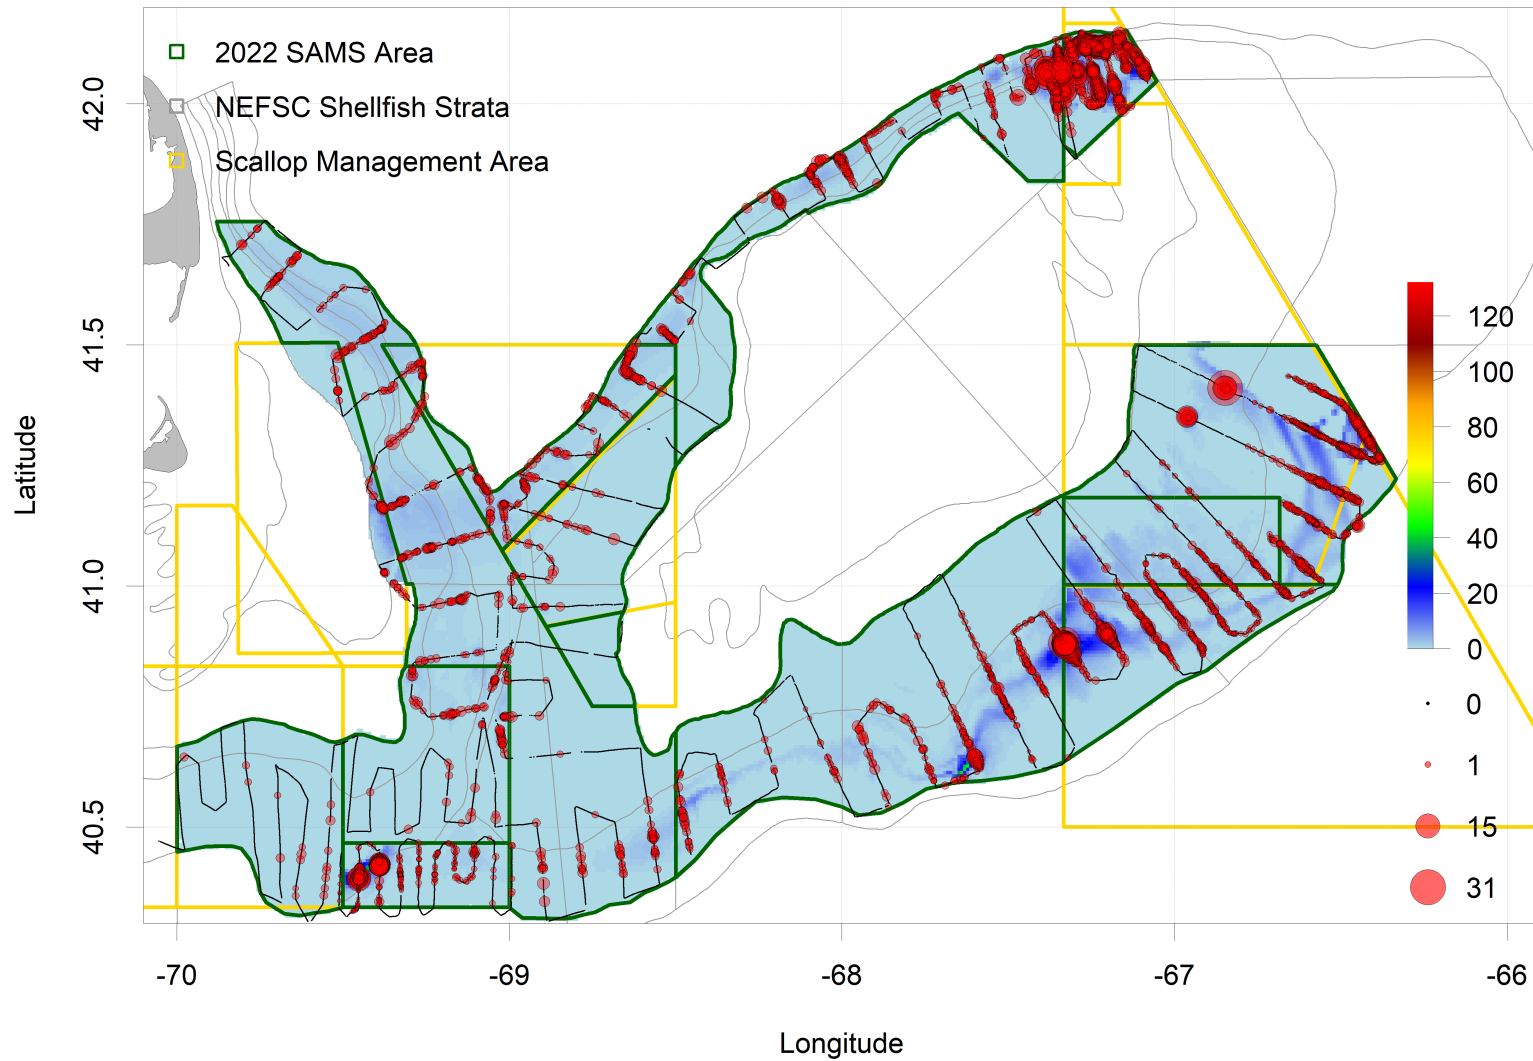

Figure 2.5. The number of >75 mm scallops observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam biomass estimates for 40+ mm scallops for Georges Bank.

Prediction: mt per km2 for shell height 40+ mm
Observation: # per m2 for shell height <35 mm

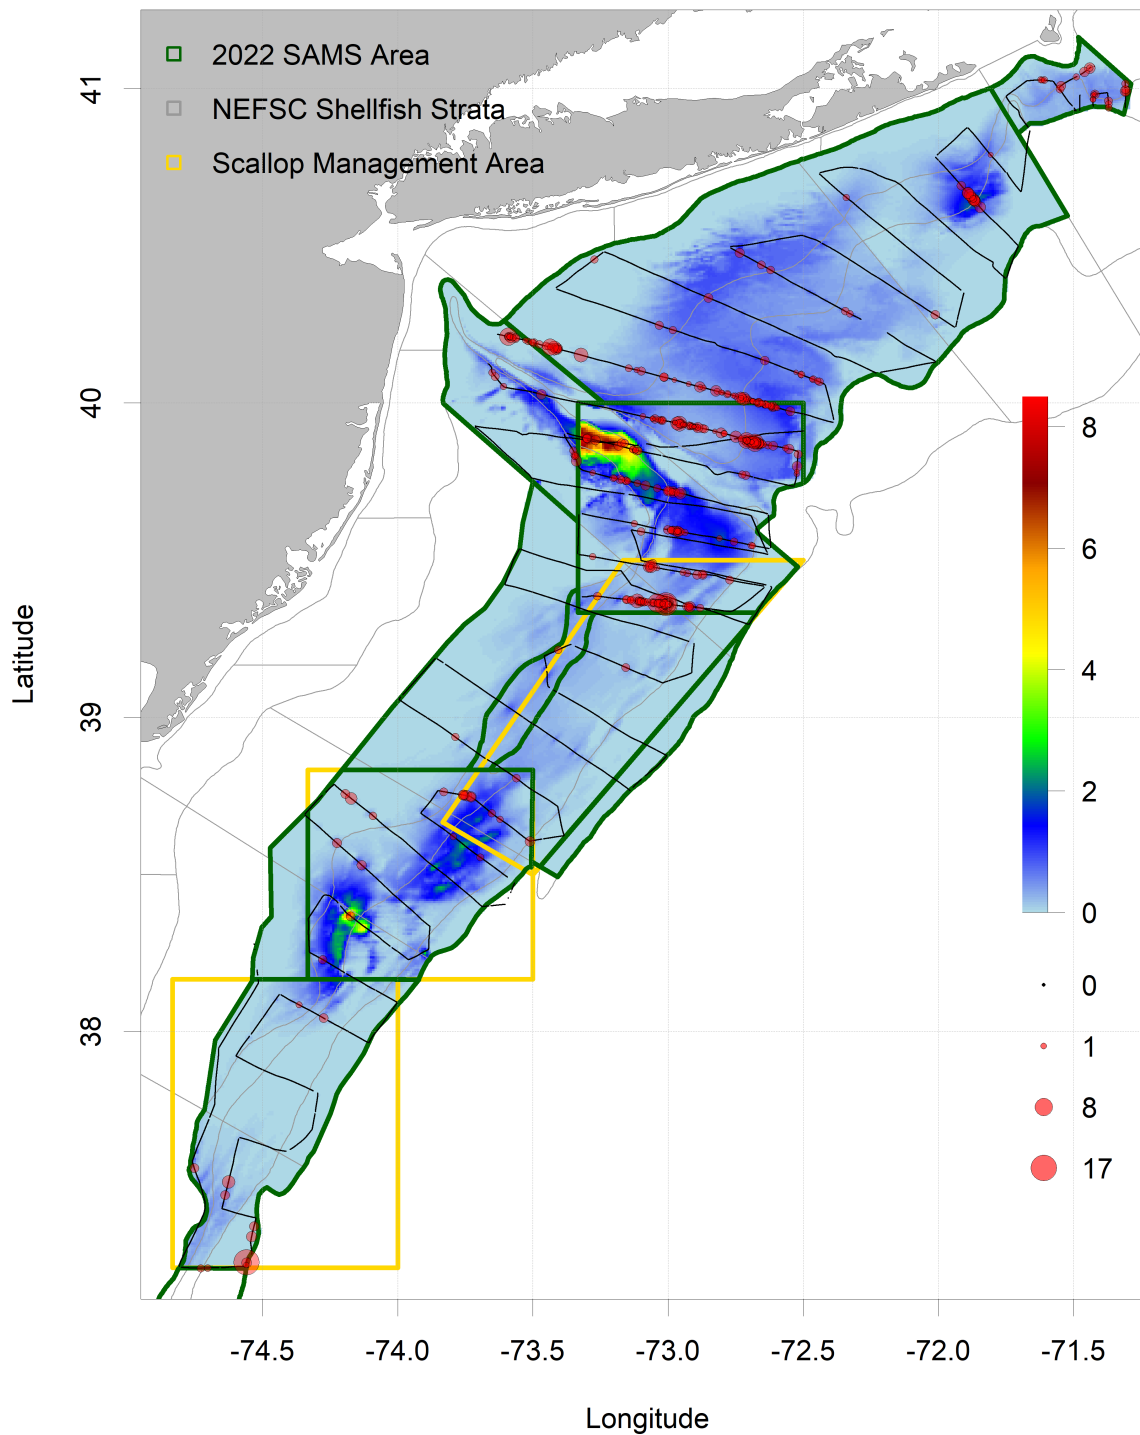

Figure 2.6. The number of <35 mm scallops observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam biomass estimates for 40+ mm scallops for Mid-Atlantic.

Prediction: mt per km2 for shell height 40+ mm
Observation: # per m2 for shell height 35-75 mm

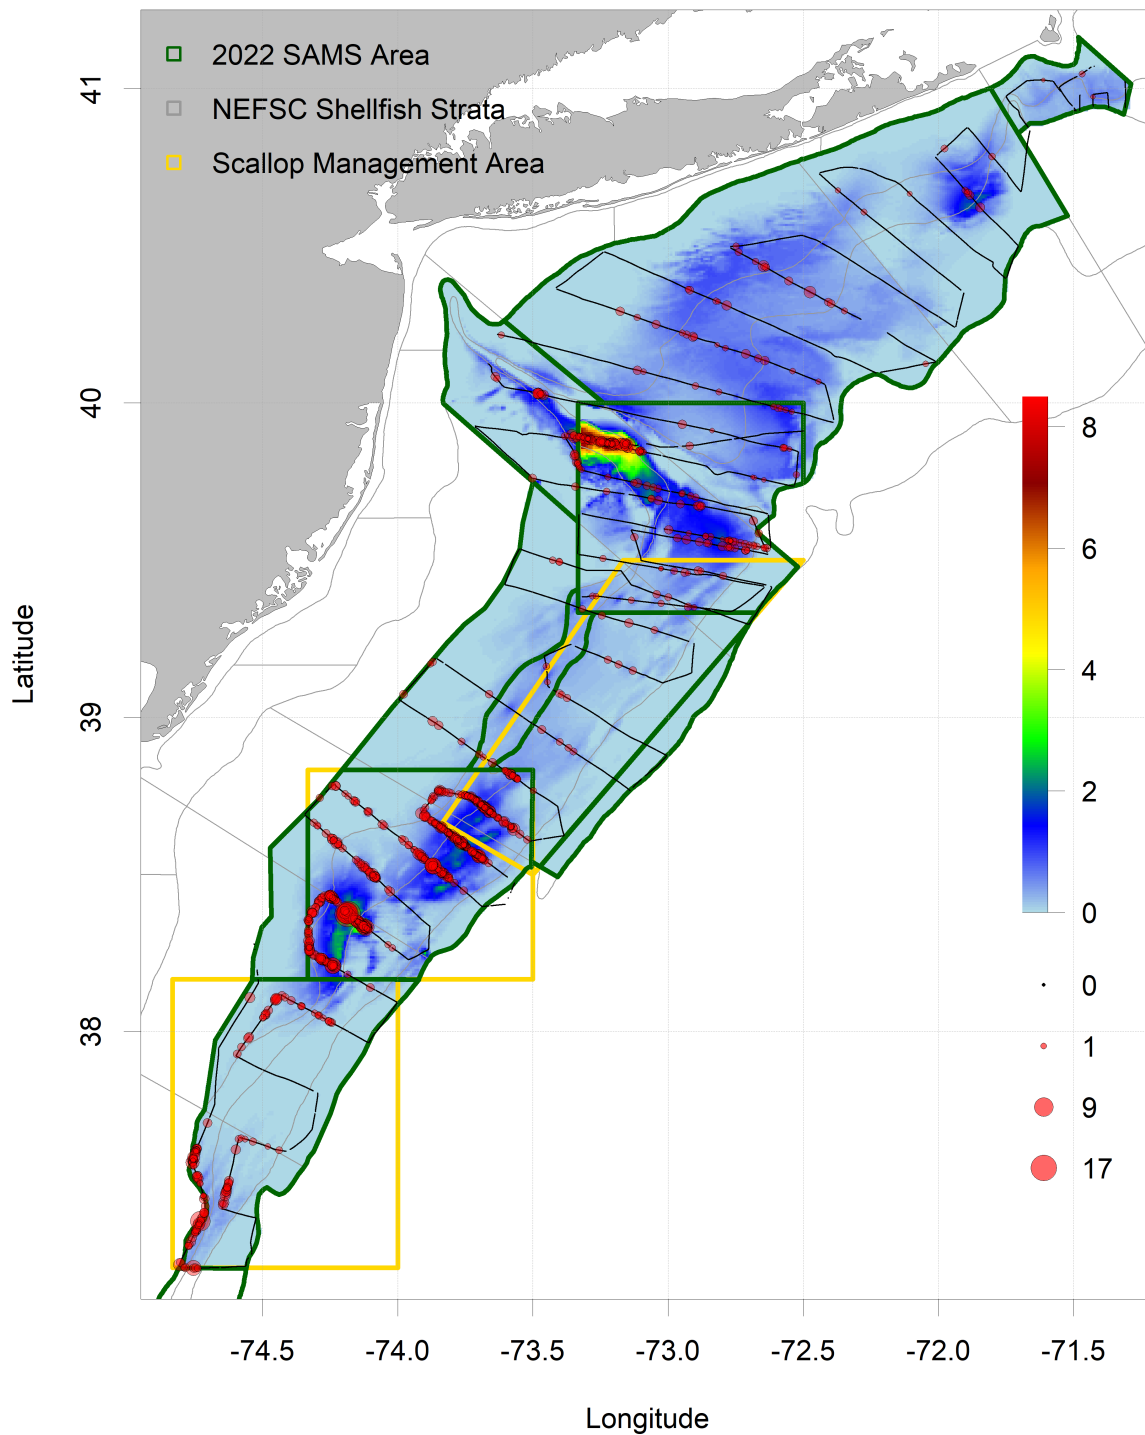

Figure 2.7. The number of 35-75 mm scallops observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam biomass estimates for 40+ mm scallops for Mid-Atlantic.

Prediction: mt per km2 for shell height 40+ mm
Observation: # per m2 for shell height >75 mm

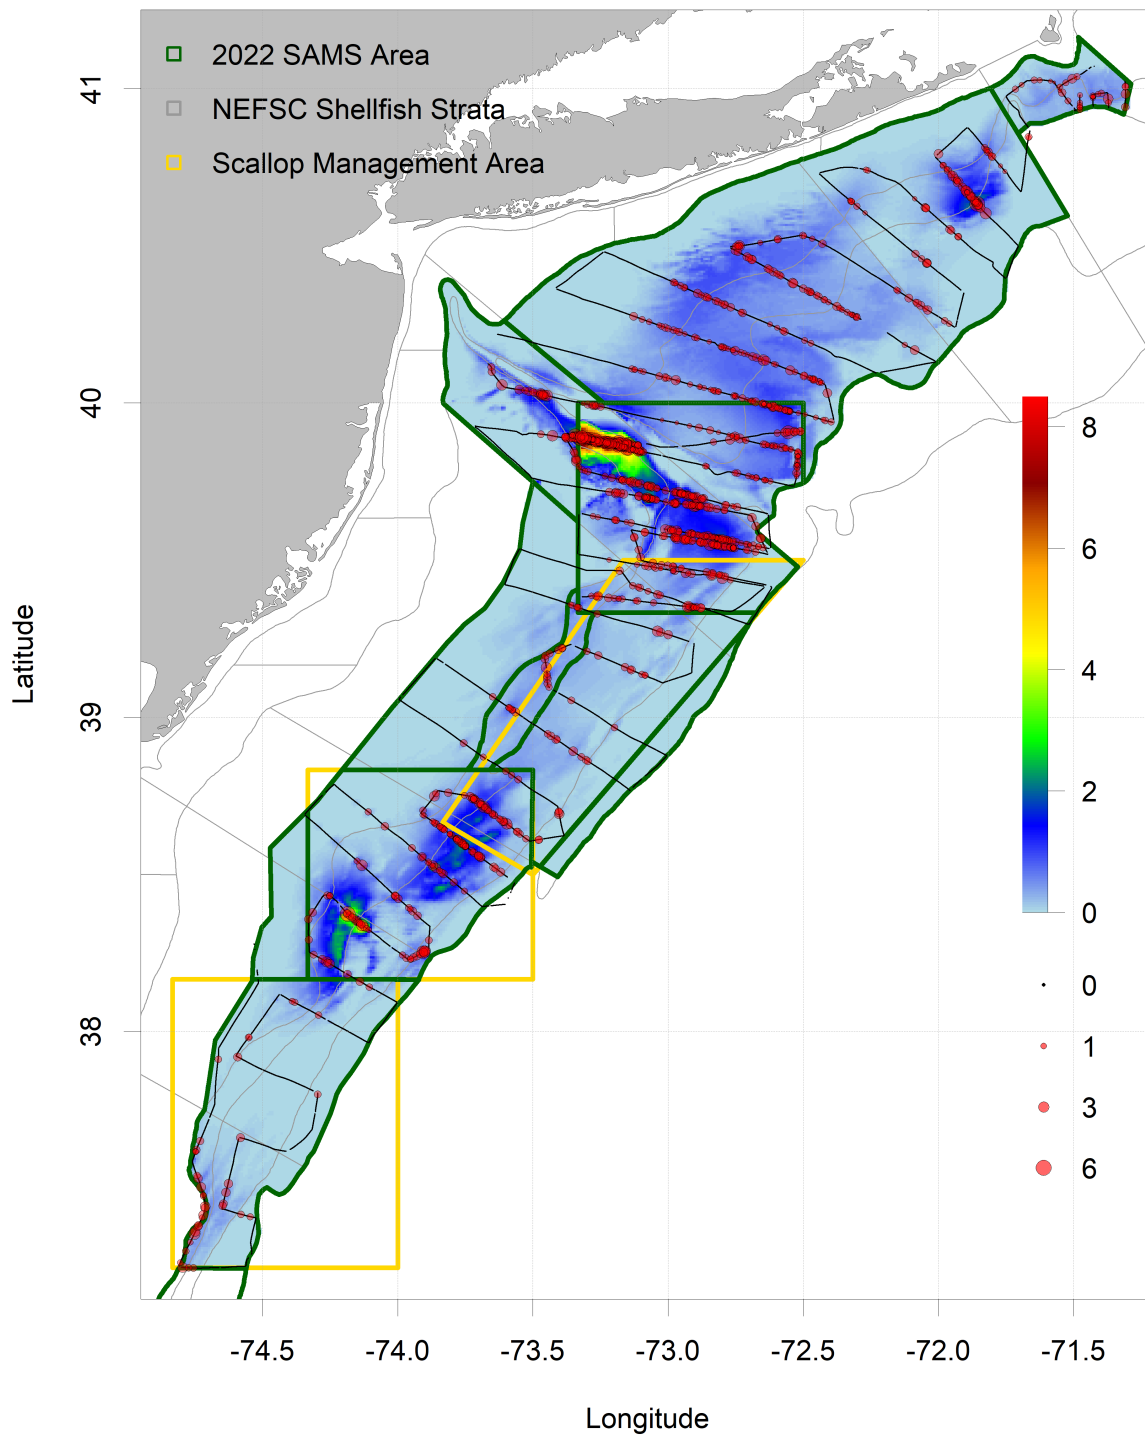

Figure 2.8. The number of >75 mm scallops observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam biomass estimates for 40+ mm scallops for Mid-Atlantic.

3 LENGTH FREQUENCY PLOTS BY SAMS AREA

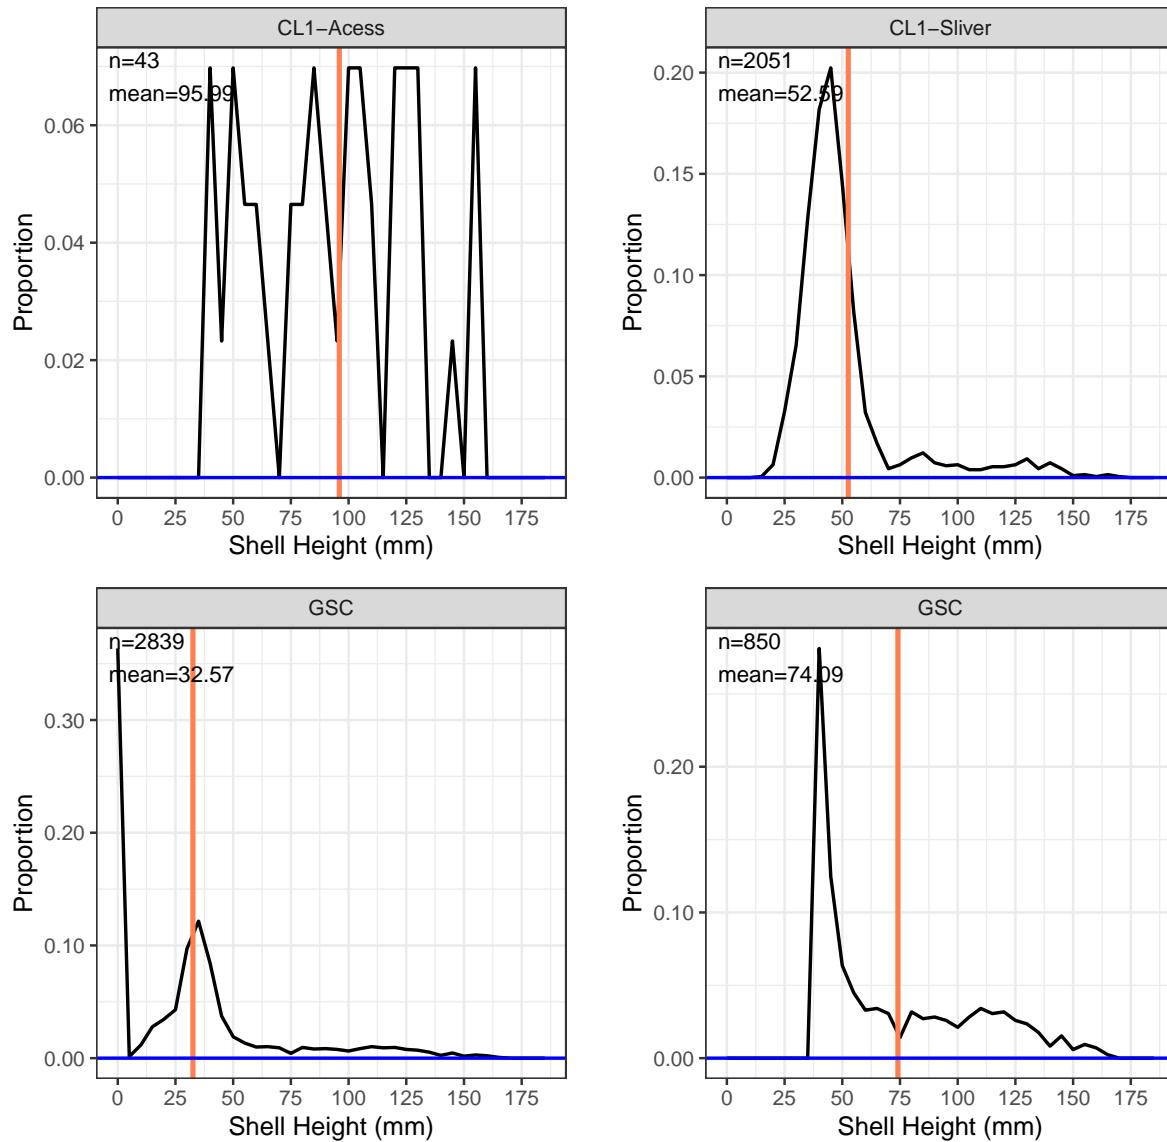

Figure 3.1. The 2022 Habcam size frequencies, mean shell height, and its sample size by SAMS area for 0+ mm scallops using combined data from NEFSC and CFF surveys for Georges Bank. Both 0+ mm and 40+ mm size frequencies were provided for areas with large portions of seeds observed (GSC, CL2-Ext, SF, NLS-North, NLS-South, and NLS-West).

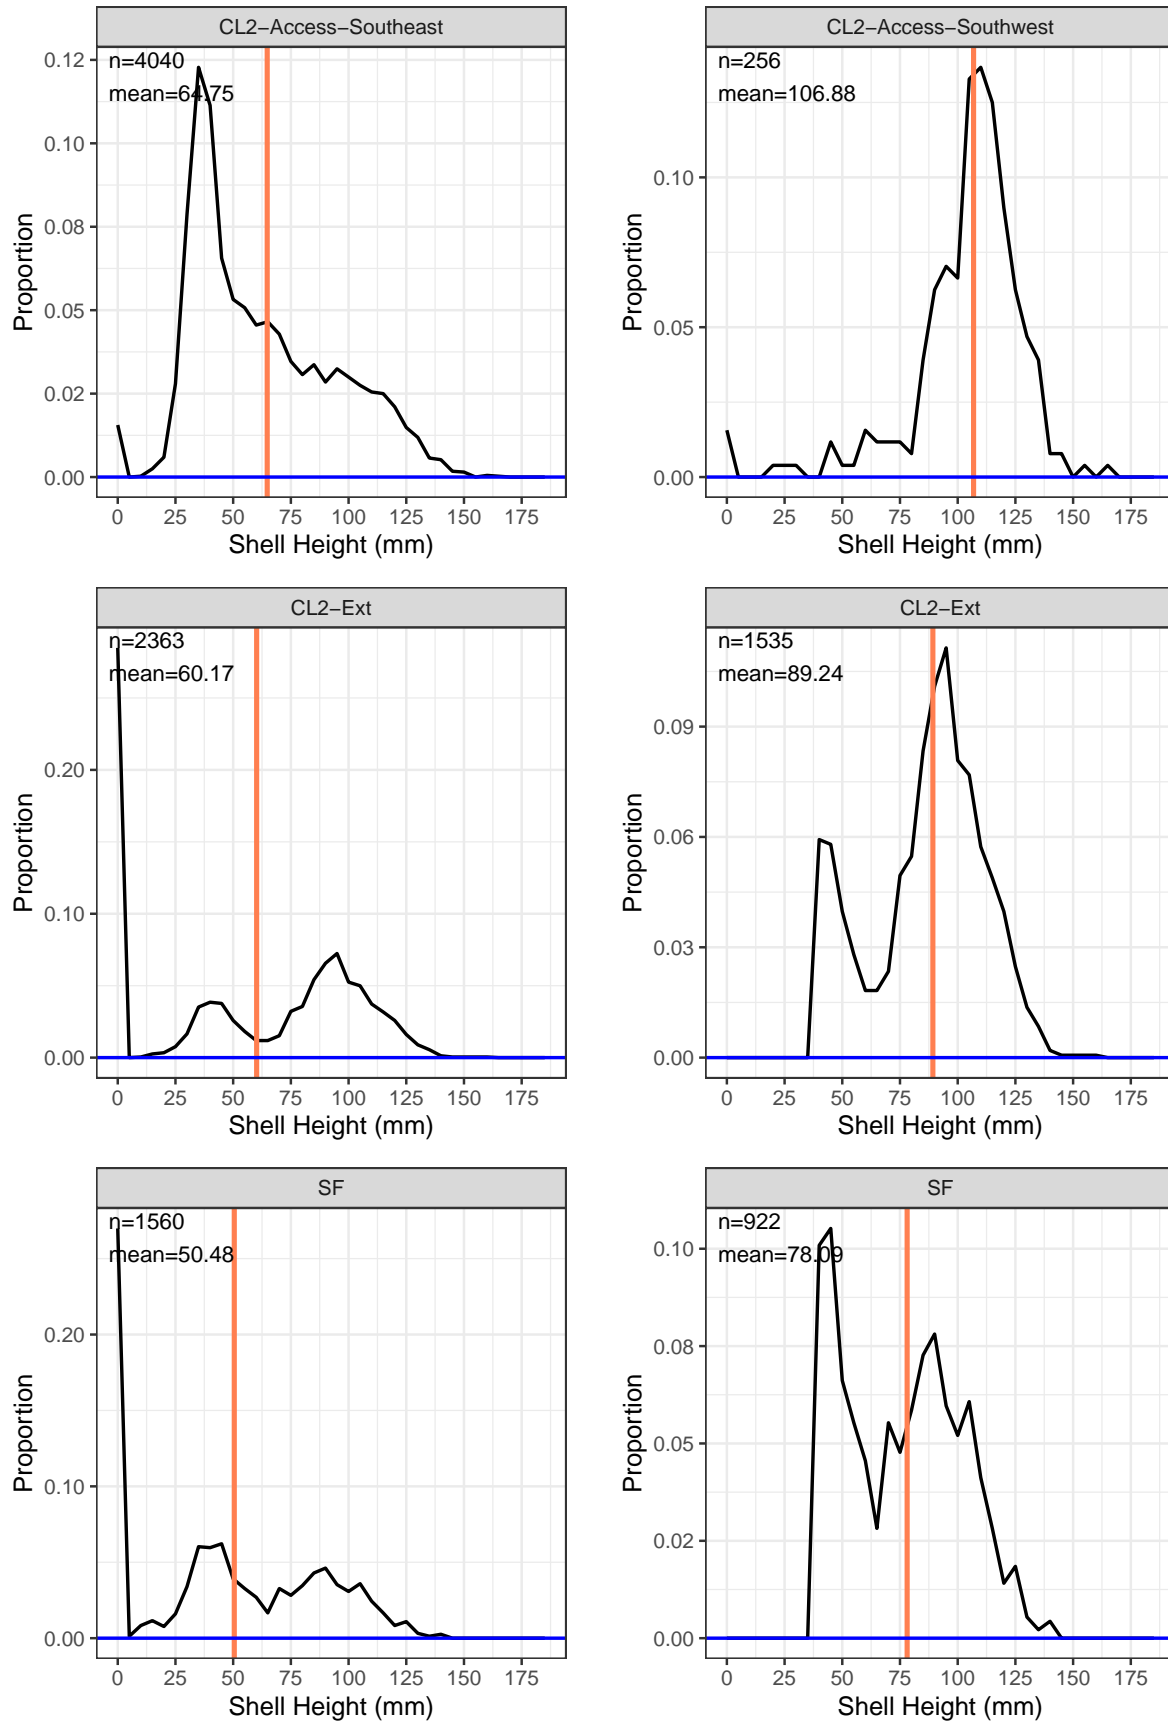

Figure 3.1. Continued.

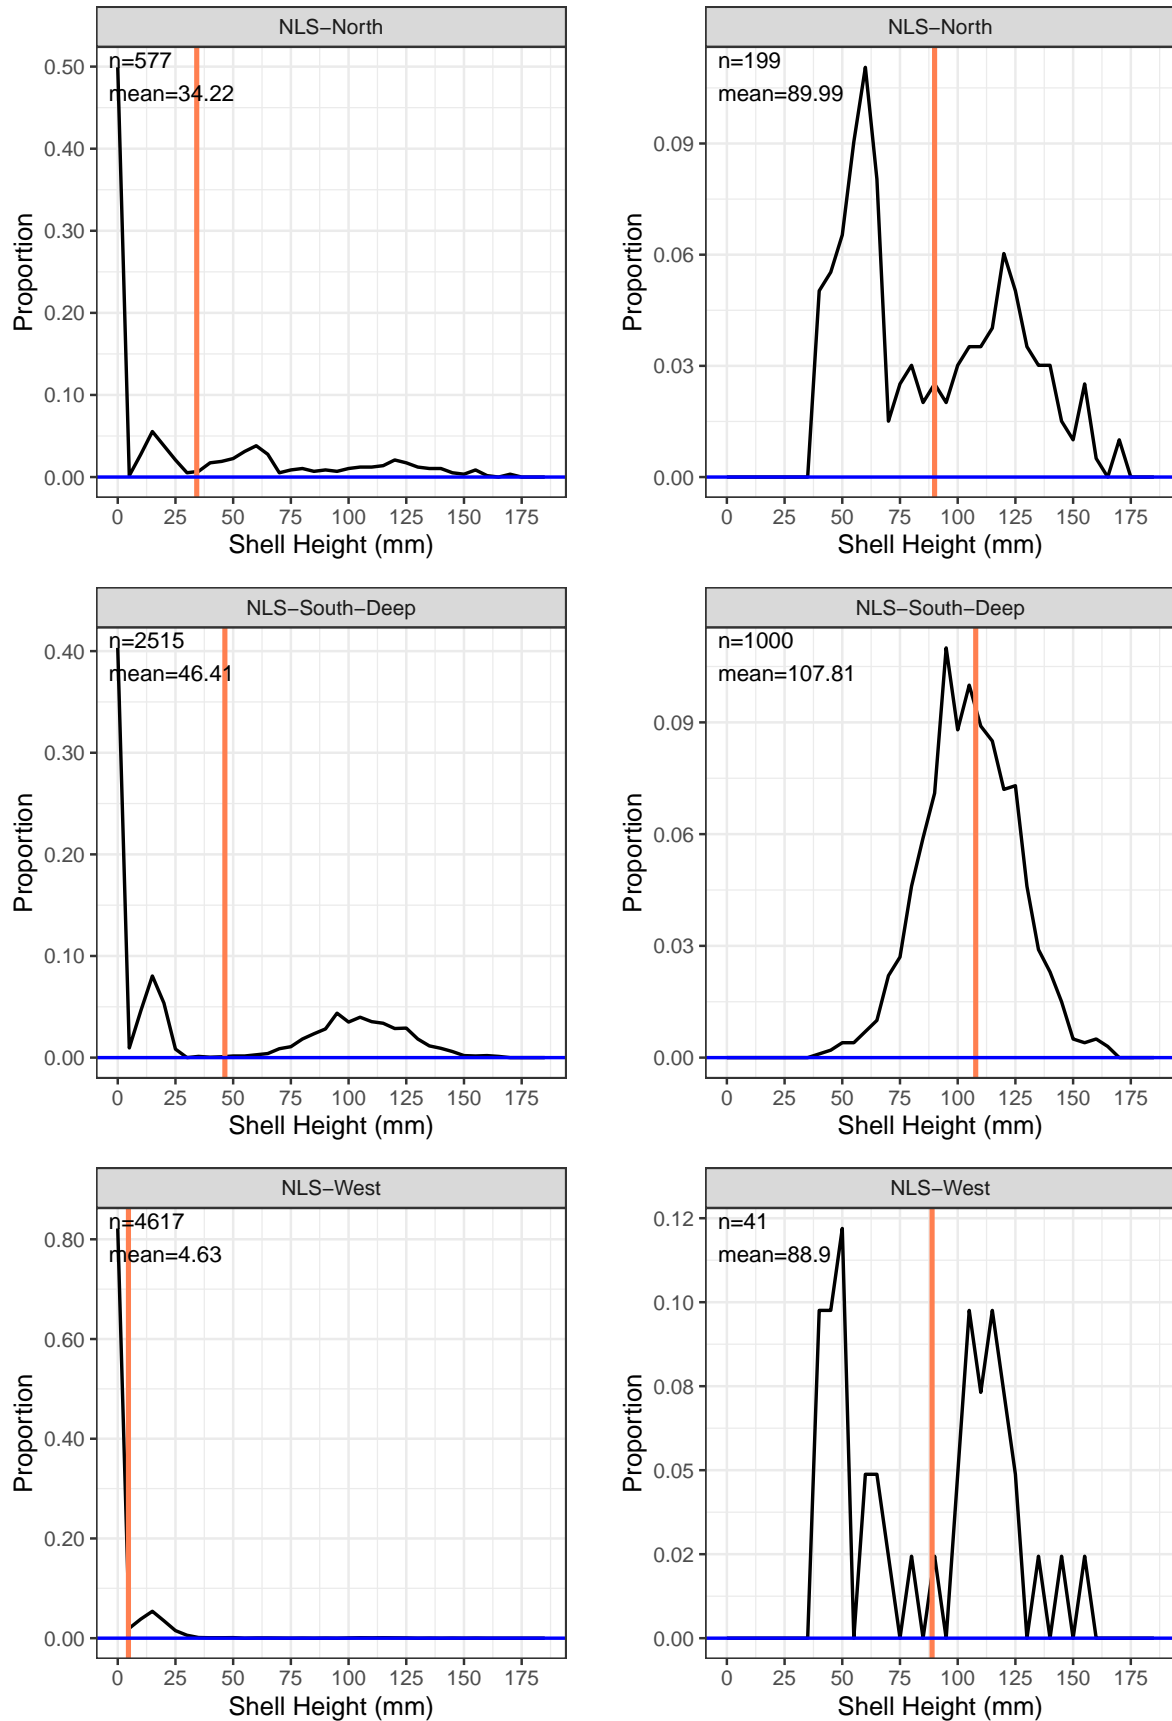

Figure 3.1. Continued.

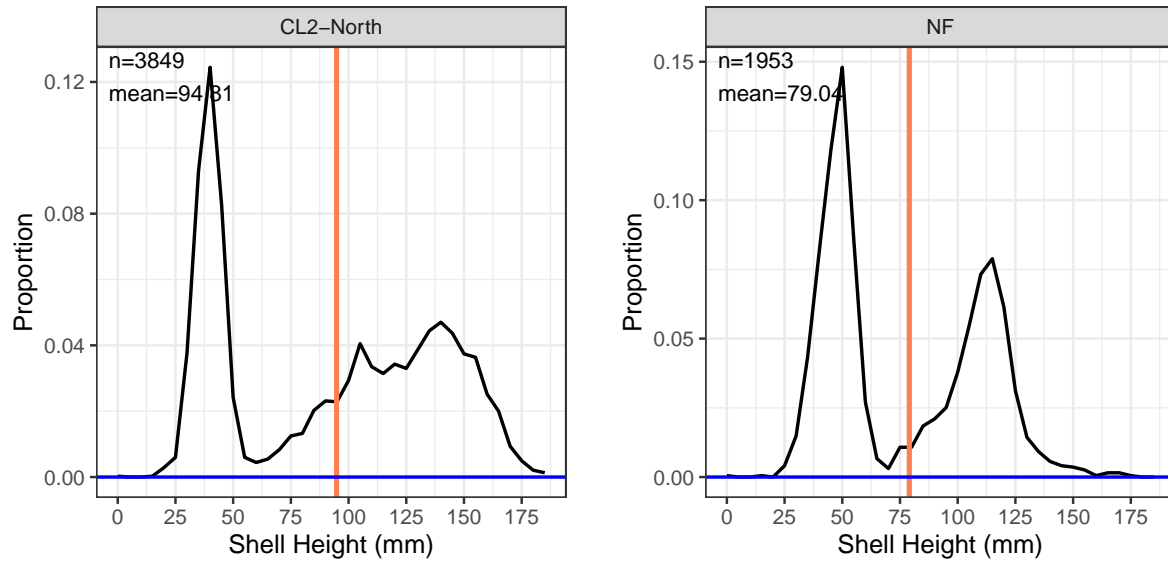

Figure 3.1. Continued.

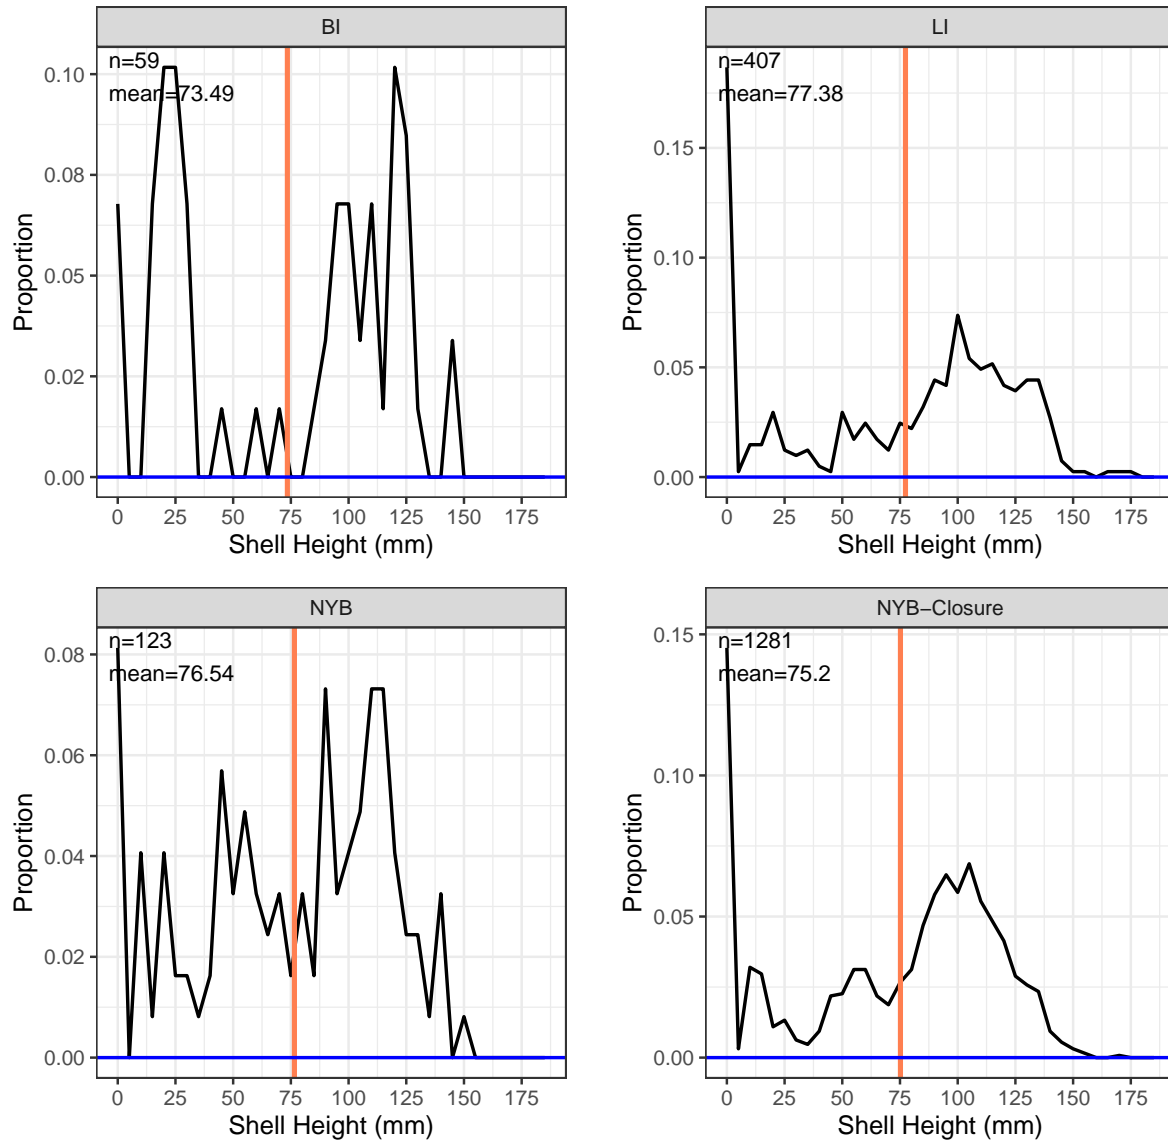

Figure 3.2. The 2022 Habcam size frequencies, mean shell height, and its sample size by SAMS area for 0+ mm scallops using combined data from NEFSC and CFF surveys for Mid-Atlantic.

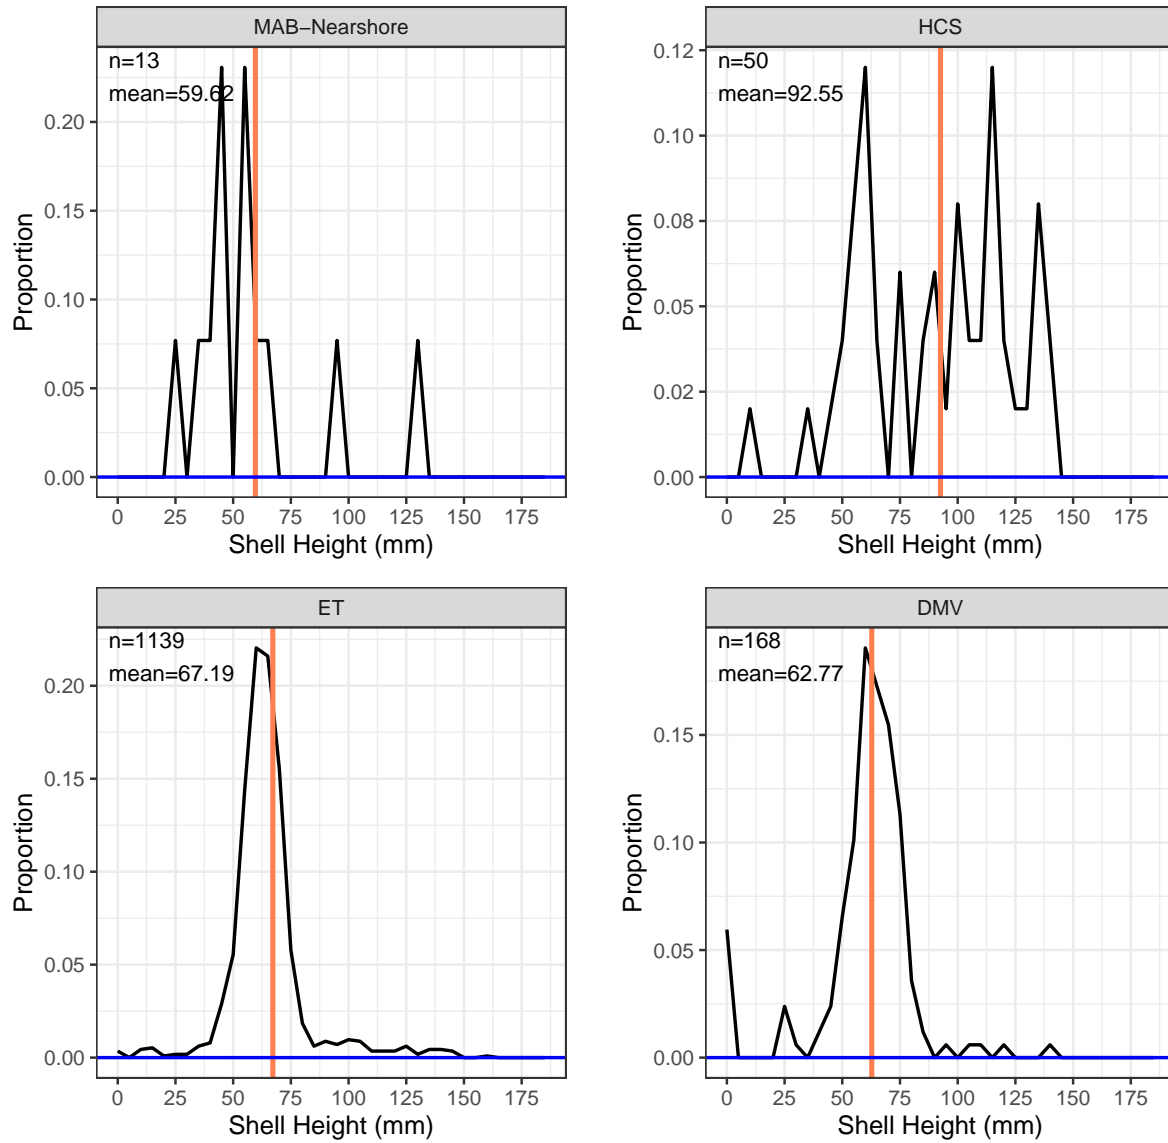

Figure 3.2. Continued.

4 ADDITIONAL ANALYSES

4.1 Comparison of NLS-South biomass estimates

Table 4.1. Comparison of 2022 Habcam biomass estimates (40+ mm) using VIMS 2016-2022 and SARC 65 SH-MW equations for NLS-South. Percent difference was calculated using biomass estimates $(\text{SARC } 65 - \text{VIMS})/(\text{SARC } 65)$.

SAMS Area	BmsMT (SARC 65)	BmsMT (VIMS16-22)	%Diff
NLS-South	2517	2043	18.84

5 SPECIAL COMMENTS

5.1 2022 Habcam survey spatial count observations and estimates for recruits

The 2022 Habcam survey observed scallop recruits (30 mm to the shell height of one year growth from 30 mm, shell height varied by location) throughout the resource, primarily in GSC, CL1-Sliver, NF, CA2-North, CA2-Southeast, CA2-Ext, SF, and ET (Figures 5.1 and 5.2). The models estimated a little over 3.6 billion of recruits from the NEFSC and CFF Habcam survey data (Table 5.1).

Table 5.1. Summary of 2022 Habcam count estimates for recruits (shell height: 30 mm to the shell height of one year growth from 30 mm).

Prediction: # per m2 for shell height 30 mm to 1 yr growth from 30
Observation: # per m2 for shell height 30 mm to 1 yr growth from 30

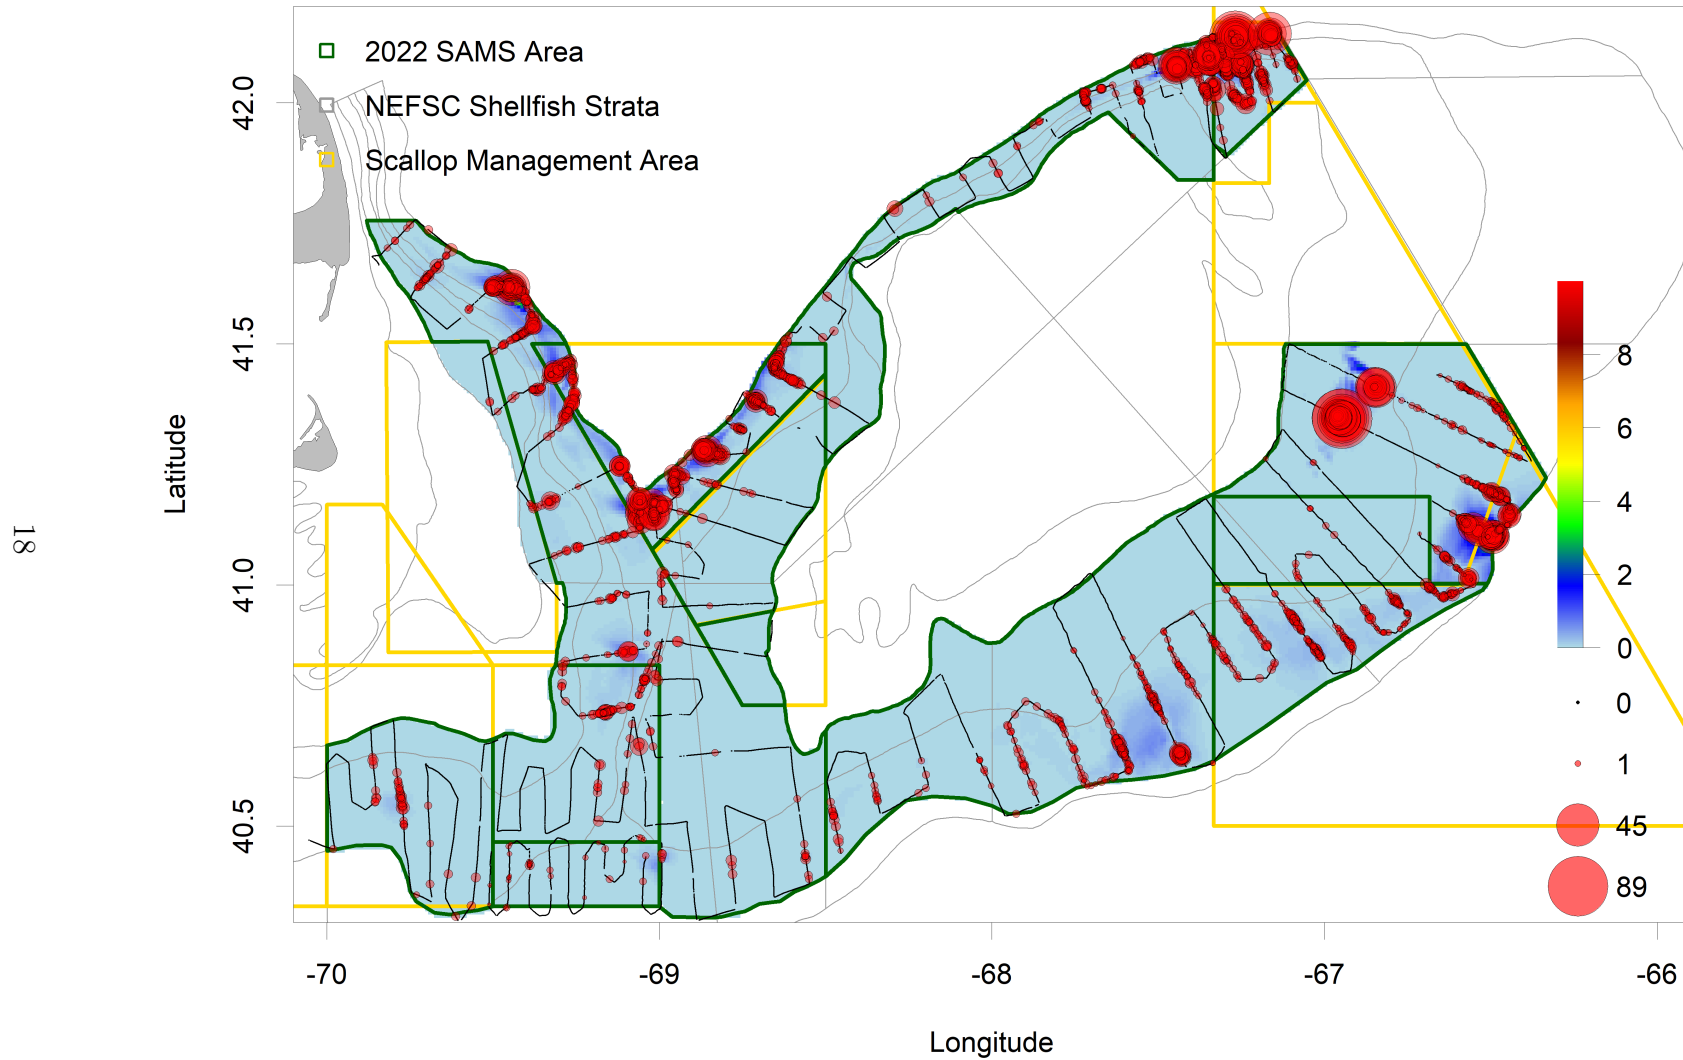

Figure 5.1. The number of recruits observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam count estimates for the recruits for Georges Bank.

Prediction: # per m2 for shell height 30 mm to 1 yr growth from 30
Observation: # per m2 for shell height 30 mm to 1 yr growth from 30

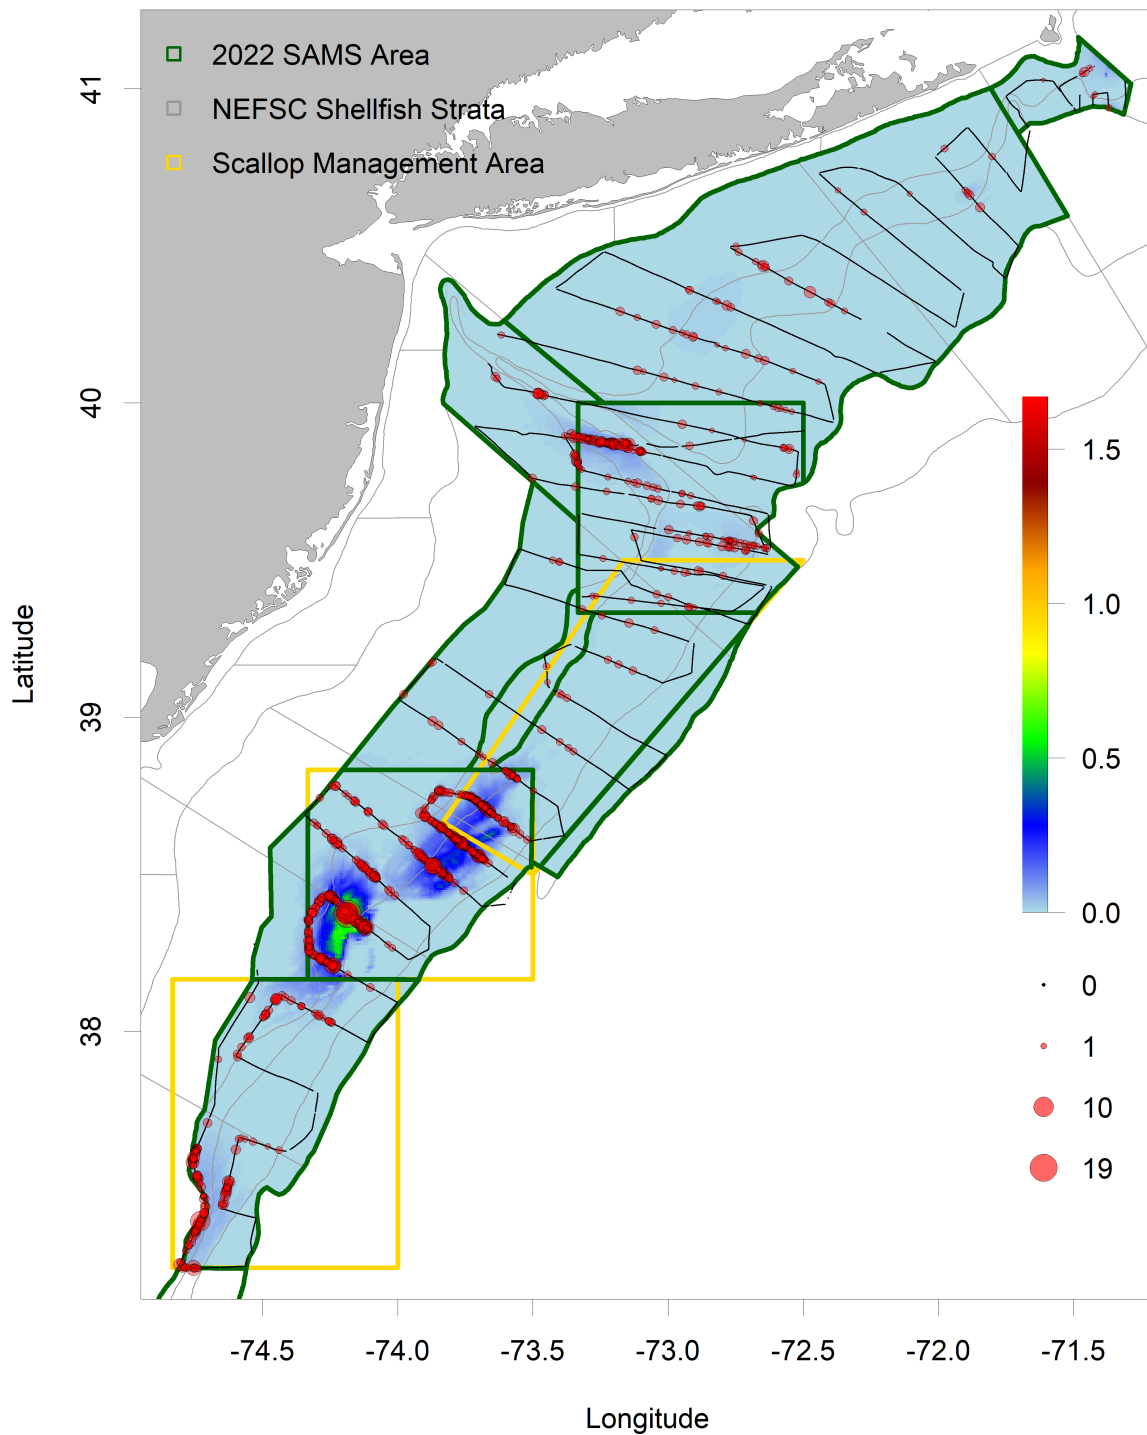

Figure 5.2. The number of recruits observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam count estimates for the recruits for Mid-Atlantic.

5.2 2022 Habcam survey clapper distribution in GB

The 2022 NEFSC Habcam survey observed a localized recruit size clapper concentration in between the areas where high density of scallop recruits were observed in GSC (Figure 5.3). The extent of this event is small but highly concentrated. Its implication for the recruits in GSC is unknown.

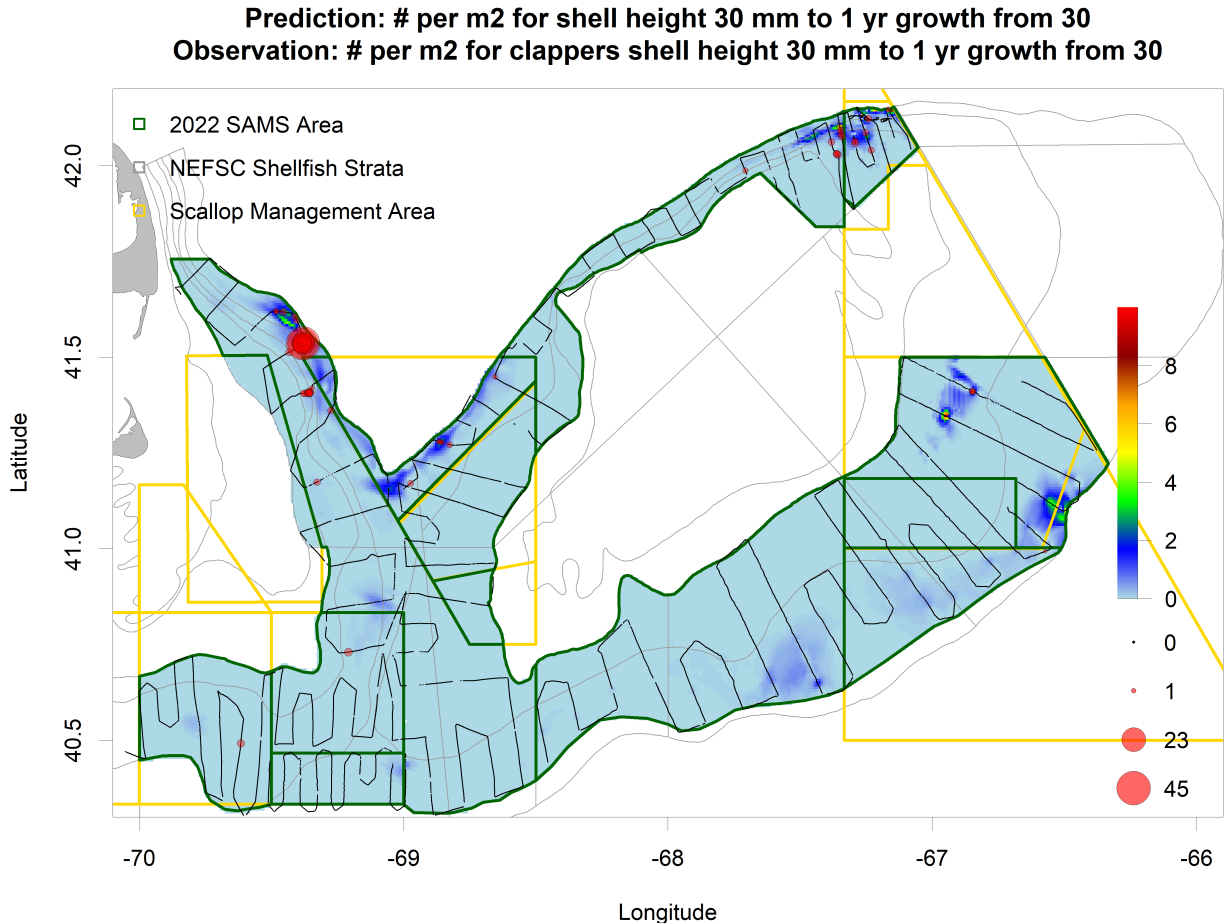

Figure 5.3. The number of recruit size clappers observed on the 2022 NEFSC and CFF Habcam surveys, along with 2022 Habcam count estimates for the recruits for Georges Bank.

5.3 2022 Habcam survey spatial count estimates for 40+ mm scallops

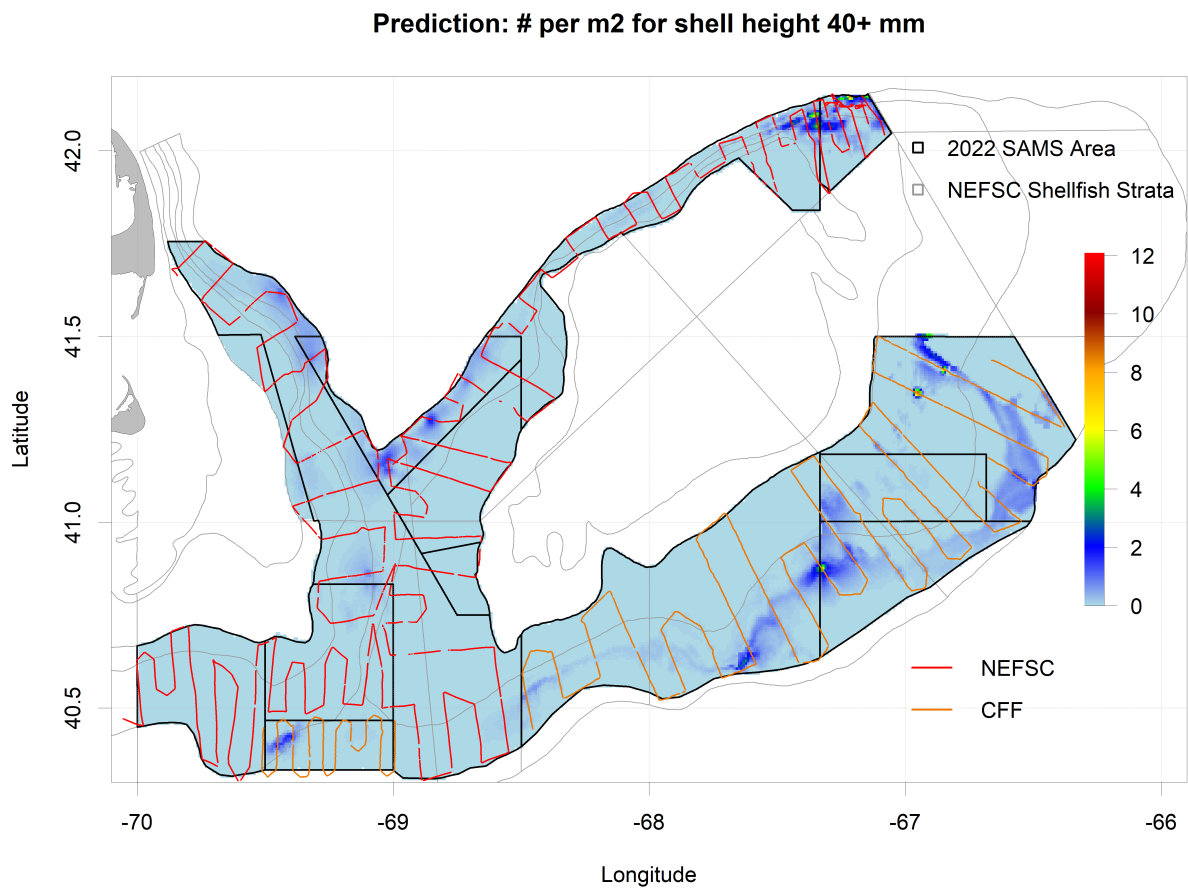

Figure 5.4. The 2022 Habcam survey tracks conducted by NEFSC and CFF, along with 2022 Habcam count estimates for 40+ mm scallops for Georges Bank.

Prediction: # per m2 for shell height 40+ mm

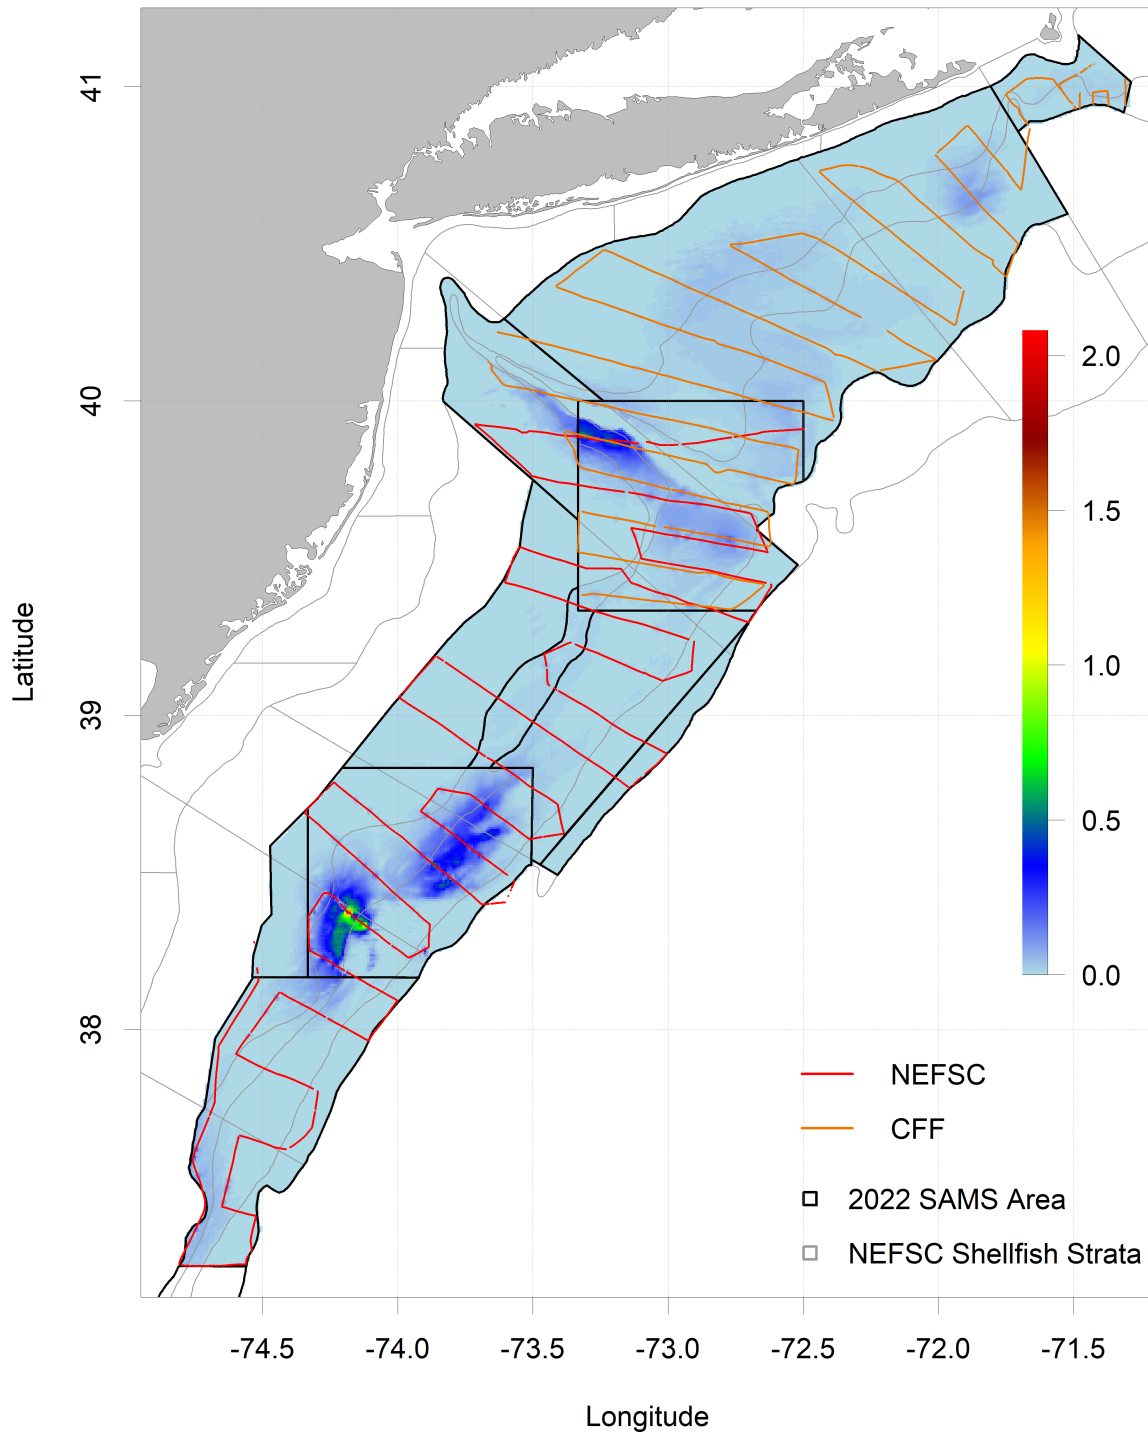

Figure 5.5. The 2022 Habcam survey tracks conducted by NEFSC and CFF, along with 2022 Habcam count estimates for 40+ mm scallops for Mid-Atlantic.

6 EXPLOITABLE BIOMASS ESTIMATES FOR 2022 (CURRENT FY)

Table 6.1. Summary of 2022 Habcam estimates for exploitable scallops using the combined data from NEFSC and CFF. SARC 65 SH-MW equations were used to estimate meat weights for all SAMS areas. Yochum and DuPaul 4-inch ring selectivity was used for exploitable cutoff.
