

Northeast Skate Complex Fishery Management Plan Amendment 5 Discussion Document

DRAFT

Updated March 10, 2021

Prepared by the
New England Fishery Management Council
In consultation with the
National Marine Fisheries Service

1.0 PRELIMINARY NOTE

The New England Fishery Management Council (NEFMC) is charged with developing management plans that meet the requirements of the Magnuson-Stevens Act (MSA). The Northeast Skate Complex Fishery Management Plan (FMP) contains the management measures for seven skate species (barndoor, clearnose, little, rosette, smooth, thorny, and winter skates) off the New England and Mid-Atlantic coasts. The FMP has been updated through a series of amendments, framework adjustments and specification packages.

This Discussion Document encapsulates the work of the Council to date on Amendment 5 to the Northeast Skate Complex FMP, an amendment to consider measures related to limited access in the fishery. Though the Council has been discussing the potential development of a skate limited access for some time, the Skate Committee (Committee) has been specifically working to develop this action since the spring of 2019. More information is available at the Council’s [website](#).

Key updates since December 2020 Council meeting:

- Clarification to Table 12 and Figure 3 that the 500 lb wing weight incidental limit has been in place since FY 2010.
- Addition of Table 13: Number of active non-bait (wing) vessels by gear type for all non-bait (wing) landings and for non-bait (wing) landings over 1,135 lb whole weight at least once during the fishing year, FY 2003-2019.
- Improved description of when incidental limits have been triggered in the skate fishery, Section 5.6.1.3.
- Revision and updates to skate landings by gear and vessel dependence (Sections 5.6.1.5 and 5.6.1.6)

3.0 INTRODUCTION

3.1 GOAL AND OBJECTIVES OF NORTHEAST SKATE COMPLEX FMP

The goal and objectives of the Northeast Skate Complex Fishery Management Plan are unchanged since the original FMP was adopted in 2003.

Goal: Consistent with the requirements of the Magnuson-Stevens Fishery Conservation and Management Act and other applicable laws, to develop a Fishery Management Plan to research and manage the Northeast Skate Complex at long-term sustainable levels.

Objective 1: Collect information critical for substantially improving knowledge of skate fisheries by species and for monitoring: (a) the status of skate fisheries, resources, and related markets and (b) the effectiveness of skate management approaches.

Objective 2: Implement measures to: protect the two currently overfished species of skates (barndoor and thorny) and increase their biomass to target levels, reduce fishing mortality on winter skate, and prevent overfishing of the other species in the Northeast skate complex – this may be accomplished through management measures in other FMPs (groundfish, monkfish, scallops), skate-specific management measures, or a combination of both as necessary.

Objective 3: Develop a skate permit system, coordinate data collection with appropriate state agencies for vessels fishing for skates or catching skates as bycatch only in state waters, and work with the fishing industry to establish a catch reporting system consistent with industry capabilities, including the use of study fleets.

Objective 4: Minimize the bycatch and discard mortality rates for skates caught in both directed and non-directed fisheries through the promotion and encouragement of experimentation, conservation engineering, and gear development.

Objective 5: Promote and encourage research for critical biological, ecological, and fishery information based on the research needs identified in the Skate SAFE Report and scoping document, including the development and dissemination of a skate species identification guide.

Objective 6: Minimize, to the extent possible, the impacts of skate management approaches on fisheries for other species on which New England and Mid-Atlantic fishermen depend (for example, groundfish, monkfish, scallops, and fluke), recognizing the interconnected nature of skate and other fisheries in the Northeast Region.

Objective 7: To the extent possible, manage clearnose and rosette skates separately from the other five species in the skate complex, recognizing that these two species are distributed primarily in the Mid-Atlantic and South Atlantic regions.

PDT Comment:

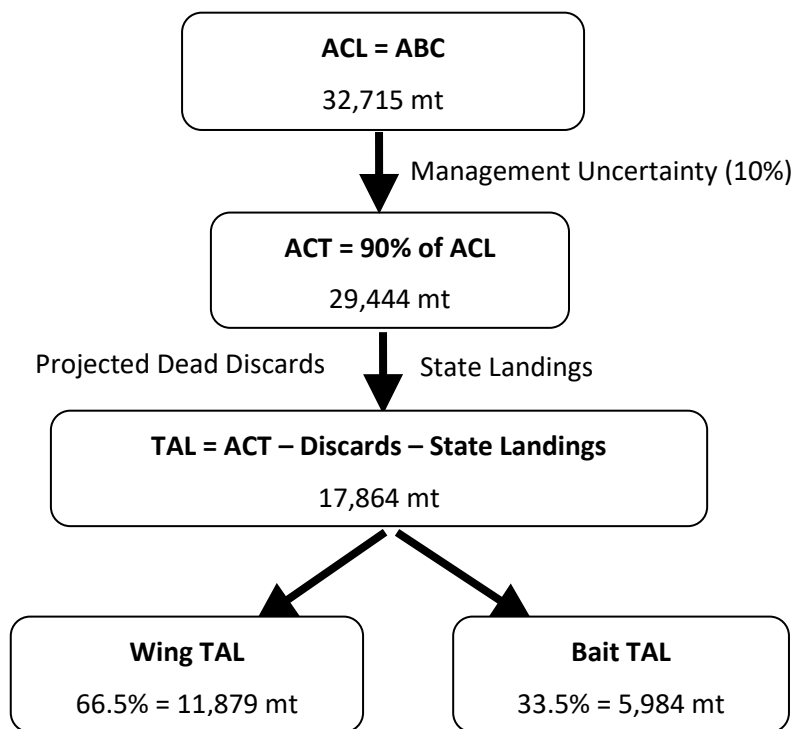

Some of the objectives are now outdated or should be made broader:

- Objective 2 - This should be updated or made less specific. Thorny skate is the only skate species that is overfished. Barndoor was declared rebuilt in 2016. Winter skate is the most caught species in the wing fishery, and it is a stable stock.
- Objective 3 – A skate permit system and a catch reporting system have been developed. Catch reporting could continue to improve.
- Objective 5 – The scoping document referred to is likely the one for the original FMP. This should be updated or made less specific to refer to the latest research priorities approved by the Council.
- Objective 7 - There are no measures that address this objective. Clearnose and rosette skates make up a small percentage of overall skate catch.

3.2 EXISTING MANAGEMENT SYSTEM

The Northeast Skate Complex Fishery Management Plan (Skate FMP) specifies the management measures for seven skate species (barndoor, clearnose, little, rosette, smooth, thorny, and winter skate) off the New England and Mid-Atlantic coasts. The New England Fishery Management Council (Council) sets specifications every two years for the skate complex with possession limits for the skate wing and bait fisheries. Fishery-specific (skate wing and bait) Total Allowable Landings (TAL) and possession limits are set as part of specifications according to the formula (Figure 1) established in Amendment 3 (NEFMC 2009). The fisheries have different seasonal management structures and are subject to possession limits and accountability measures (AMs). Recent fishery TALs, possession limits and catches are in Section 5.6.1.

Figure 1. Formula for skate specifications setting used since Amendment 3, with FY 2020-21 values.

Thus, for FY 2020, the Wing TAL is 11,879 mt (26,188,705 live lb or 11,536,874 landed lb). The Bait TAL is 5,984 mt (13,192,458 live and landed lb).

More information on skate wing fishery regulations is at:

<https://www.fisheries.noaa.gov/species/northeast-skate-complex#commercial>.

More information on skate bait fishery regulations is at: <https://www.fisheries.noaa.gov/new-england-mid-atlantic/resources-fishing/skate-bait-fishery>.

3.3 STEPS OF AMENDMENT DEVELOPMENT/TIMELINE

The Council has been considering developing limited access in the skate fishery since at least 2009 (Table 1, [March 2020 Skate PDT memo](#)). The Council assumes that preparing an Environmental Impact Statement will be necessary. A formal determination on the type of NEPA document needed will be made once the range of alternatives is identified and analyzed.

Table 1. Council steps in developing Amendment 5.

Step	Amendment 5 timeline	Discussion Doc.
Identify a need, set an action as a priority, potentially set control dates	July 2009: NMFS set bait control date March 2014: NMFS set wing control date Dec. 2015: Council set amendment as a management priority	Sect. 3.4
Hold public scoping period	Early 2017	Sect. 3.5
Review public scoping comments	April 2017	Sect. 3.5
Set problem statement, goals, and objectives	June 2019: Council set two objectives March-September 2020: Cte develops problem statement, goals, and types of measures September 2020: Council approval	Sect. 3.6
Develop alternatives	April 2017 – October 2019: AP developing ideas, Cte tasking PDT with providing background information, generally and about AP ideas	Sects. 4.0, 5.6.1
Supplemental scoping	Mid-January – mid-February	
Continue developing alternatives	Early 2021 - TBD	
Approve range of alternatives	TBD	
Conduct impact analysis, prepare Draft EIS	TBD	
Approve DEIS, can identify preliminary preferred alternatives	TBD	
Hold public comment period on DEIS	TBD	
Consider public comments and identify final preferred alternatives	TBD	
Prepare DEIS for submission to NMFS	TBD	

Additional steps are necessary beyond those in Table 1 to translate the Council recommendations into implemented regulations. In part, it involves NMFS reviewing the DEIS, Council staff preparing a Final EIS, NMFS holding a comment period on a proposed rule and decision-making.

3.4 CONTROL DATES

Bait Control Date. At the February 19, 2009 joint meeting of the Skate Advisory Panel and Committee (there was no quorum for either body), the Committee members present agreed to bring forward at the April Council meeting the Advisory Panel’s request for a skate bait fishery control date. From the meeting summary (p. 5):

“Advisors were concerned that new entrants into the skate bait fishery could have a negative impact on current participants, especially with the fishery being managed by

quotas. Several industry members recommended that the Council set a control date for the skate bait fishery. The Oversight Committee recalled that a control date had been discussed before, but action was not taken because it could be a long time before the Council could consider and develop a limited access program.”

This was the same meeting in which final alternatives were recommended for Amendment 3, the action that implemented an annual catch limit framework with accountability measures to account for any excess catch, or overages, and prevent overfishing. Other measures included a three-season quota allocation, a 20,000 lb whole skate possession limit and a 1,900 lb skate wing (4,313 lb whole) possession limit. For both fisheries, the Council approved triggers that would automatically reduce the possession limits to an incidental limit of 500 lb of skate wings (1,135 pounds whole) once landings reach 80-90% of the amount allocated to each fishery. The new measures were intended to reduce landings and the total catch of skate and promote increased biomass to rebuild smooth and thorny skates, which were overfished. It also addressed the concern that winter skate could become overfished if high catches continue.

At the April 7-9, 2009 Council meeting, after taking final action on Skate Amendment 3, the Council approved a motion “to request NMFS to publish a control date for the skate bait fishery.” The maker of the motion was concerned that considering limited access was necessary since the Council “just cranked down the landing limits to draconian levels.” There was some discussion about whether a certain amount of bait landings would be used to qualify vessels for limited access or simply if a vessel had a Letter of Authorization for Skate Bait (LOA). At the February Committee meeting, the idea had been discussed to use a certain weight of landings from the previous 10 years to qualify vessels, generally consistent with the criteria for other limited access programs.¹ One skate bait dealer from the public stated that the bait fishery supports a control date to “best manage the future of the fishery.” After a Council member suggested that a discussion about criteria could occur in the future, the Council approved the motion (15/0/1). NMFS published the bait control date on July 30, 2009.

Wing (non-bait) Control Date. Following a lengthy discussion at the December 2013 Council meeting on establishing limited access for the skate fishery, it was not prioritized for 2014. At a January 9, 2014 joint Skate AP-Committee meeting, the Committee selected preferred alternatives for Framework Adjustment 2 (with final action by the Council in January). Framework 2 set specifications for FY 2014 and 2015 and revised the VTR and dealer reporting codes for the bait and wing fishery (made species-specific codes). At this meeting, the Committee passed a motion “that the Council request NMFS publish a control date for the skate fishery for uses other than bait” (4/0/2).

The intent was not to change Council priorities or initiate an amendment for limited access but to take the first step towards achieving that priority. The intent was also to not revise the skate bait control date but cover all components of the skate fishery other than bait. The AP and Committee did not generally support changing the bait control date. The term “for uses other than bait” was approved so that species-specific control dates would not have to be established if a use other than wing and bait was developed. The Committee wanted to restrict future uses of skates especially if currently prohibited species rebuild. The Council Chair noted that this has been listed as a priority for several years but because of overall workload has not been prioritized. It was hoped that this could be prioritized for 2015. The Committee motion passed at the January 2014 Council meeting (15/0/1) with no discussion. NMFS published the control date on March 31, 2014. In November 2014, the Council did not approve developing amendment to consider limited access in the skate fishery as a 2015 management priority. In December 2015, the Council approved this as a 2016 management priority.

¹ Landings data ten years before 2009 may not be differentiated by species, and possibly disposition (bait/wing).

3.5 ORIGINAL PUBLIC SCOPING

At the October 11, 2016 Skate AP meeting (no quorum), AP members present approved the Amendment 5 public scoping document. There was general agreement that limited access was favorable and beneficial to the bait and wing fisheries. The Skate Committee approved the scoping document on October 19, 2016. The Council approved the Amendment 5 [public scoping document](#) in November 2016.

On Page 4 of the scoping document, the Council gave this reason for developing Amendment 5:

“The Northeast Skate Complex fishery remains an open access fishery – any vessel can join or leave the fishery at any time. In contrast, the majority of fisheries in the New England region have adopted limited access. Limited access in the skate fisheries would prevent unrestrained increases in fishing effort by new entrants to the fishery.”

Concerns were described on Page 5:

“Participants in both skate fisheries are concerned that increasingly strict regulations in other fisheries, particularly in the Northeast multispecies fishery where several stocks are overfished and subject to strict catch restrictions, might cause these fishermen to switch over to fishing for skates. An increase in effort in the skate fishery could trigger reduced skate trip limits and have other negative economic impacts on current participants because skate markets are still developing and therefore an influx of product could reduce price.”

Additional rationale was provided on Page 7:

“New measures to establish limited access permits are being considered because the Northeast Skate Complex fishery remains one of the few open access fisheries in New England. Until access to the fishery is limited, the bait and non-bait (wing) fisheries are at risk from overcapacity problems. Limited access measures may differ for the bait and skate fisheries to reflect the distinct operations of each fishery. The amendment’s objective would be to establish qualification criteria for skate (bait and non-bait [wing]) fishing permits and possibly different qualification criteria or catch limits for each fishery, considering how they operate differently. For example, in the wing fishery, it may be desirable to have different tiers that distinguish between vessels that target skate, vessels that historically targeted skate, and vessels that catch and land smaller quantities of skate. Having different categories of limited access vessels may treat vessels differently based on their individual history, distinguishing those that have targeted skate from those that catch and land skate while fishing for other species. Landing limits for qualifiers and non-qualifiers could therefore be more consistent with the type of fishing that these vessels conduct in order to minimize discarding and economic effects. Some historic participants in the Northeast Skate Complex fisheries may also feel entitled to some limited access privileges.”

The scoping hearings occurred in January-February 2017. The PDT summarized comments (see March 20, 2017 PDT meeting summary). There were 17 written comments and 31 oral comments. There was mixed support for limited access, with no discernable trend among bait and wing fishermen or by geography or other affiliation. The written comments suggested a slight preference for limited access; however, the spoken comments indicated more opposition to limited access. Stock status and abundance were a factor in several public comments. If the quota were to increase, then support for limited access may change for some participants. Some comments supported updating the bait control date. In April 2017, the Skate Advisory Panel, Committee, and Council reviewed the scoping comments.

3.6 AMENDMENT 5 PROBLEM STATEMENT, GOALS AND OBJECTIVES

In September 2020, the Council approved the following problem statement, goals, and types of measures to consider that may achieve the goals for this action (Goals 6 and 7 were approved in June 2019 also; problem statement was further clarified by the Council in December 2020).

Problem Statement:

There are two modes of the skate fishery, directed and non-directed fisheries. An incidental limit has been triggered five times since first implemented in July 2010, and when it gets triggered, there are negative impacts on the directed skate fishery and on the other fisheries that incidentally harvest skate.

There is a need to improve the reliability and accountability of catch reporting in the skate fishery (and other fisheries that catch skate) to ensure there is precise and accurate representation of catch (landings and discards). Accurate catch data are necessary to ensure that catch limits are set at levels that prevent overfishing and to determine when catch limits are exceeded.

Current and potential access to the skate resource make it difficult to achieve long term sustainable management in the skate fishery. It is more difficult to prevent overfishing and predict outcomes of management when participants in a fishery cannot be defined.

Goals:

1. Avoid tripping the skate incidental possession limit.
2. Improve skate data, leading to improved assessments (e.g., no longer be considered data-poor) and more precise and accurate understanding of the landings and discards in different segments of the fishery.
3. Minimize discards.
4. Better characterize the directed and non-directed fisheries.
5. Better understand the true potential for vessels to enter the fishery.
6. Minimize the impact on any other fisheries that have interactions with skates.
7. Preserve, to the extent possible, ongoing participation in the fishery consistent with how past utilization has occurred.

Types of measures to consider for achieving the goals:

1. An intermediate trigger to slow the wing and/or bait fishery.
2. Limited access for the wing and/or bait fishery, with or without tiers for different qualification criteria for permit categories.
3. Creating different TALs for the wing fishery segments (e.g., directed and non-directed TALs).
4. Monitoring requirements for the wing and/or bait fishery beyond NEFOP/SBRM requirements.
5. Restrict switching between state and federal fishing for the wing and/or bait fishery.
6. Gear modifications that could reduce bycatch for the wing and/or bait fishery (e.g., 12” mesh gillnet size).
7. Make the Federal skate permit a year-round permit for the wing and/or bait fishery.
8. Additional reporting requirements for the wing and/or bait fishery (e.g., VMS declarations, daily catch reports).

4.0 POTENTIAL QUALIFICATION TIERS

The Skate Advisory Panel drafted alternatives for limited access in 2019.

The Skate Committee or NEFMC have NOT approved these for inclusion in Amendment 5.

PDT comment: If the Council develops alternatives that are specific to wing and bait, it should be clarified how the landings using other disposition codes would be treated (e.g., bait and non-bait).

4.1 DRAFT WING CRITERIA – NOT YET APPROVED BY COMMITTEE OR COUNCIL

The Skate Advisory Panel proposed wing limited access permit qualification criteria in May 2019 (Table 2). **The Skate Committee has not moved this proposal as an alternative** for Amendment 5 but tasked the PDT with identifying the vessels, landings and revenue that would fit within these criteria (Table 3).

Table 2. AP-developed qualification criteria for limited access in the skate wing fishery.

Qualifications (wing landings in any one FY)			
Wing Group	FY 2003 to Control date	Group	Control date to FY 2018
1a	≥100,000 lb	1b	≥100,000 lb
2a	75,000 to <100,000 lb	2b	75,000 to <100,000 lb
3a	50,000 to <75,000 lb	3b	50,000 to <75,000 lb
4a	25,000 to <50,000 lb	4b	25,000 to <50,000 lb

Note: Developed at the May 21, 2019 AP meeting (the wing control date is March 31, 2014).

Table 3. Qualifying vessels under draft wing LA permit criteria.

Wing Group	Number of Vessels	FY 2003-2013		
		Live Landings (lb)	Total Revenue	Revenue/Vessel
Qualifying years: FY 2003 through CD				
1a	103	261,024,631	\$55,702,491	\$540,801
2a	40	27,593,638	\$6,140,314	\$153,508
3a	46	25,546,244	\$5,816,982	\$126,456
4a	105	30,819,069	\$7,283,967	\$69,371
<i>Note:</i> these data are through the end of FY 2013 (April 30, 2014), not March 31, 2014, the CD. There could be a few vessels that fished in April 2014 that would qualify.				
Qualifying years: CD through FY 2018				
1b	12	14,208,406	\$3,622,457	\$301,871
2b	7	5,846,558	\$1,294,169	\$184,881
3b	12	4,825,303	\$1,139,982	\$94,999
4b	23	4,826,426	\$1,122,872	\$48,821
<i>Note:</i> these data are FY 2014-2018, not after March 31, 2014. There could be a few vessels that fished in April 2014 and would not qualify.				
Source: Includes all Federal landings, where vessels had a Federal permit at any time in the year.				

PDT comment: If the Committee wants to develop these qualification criteria further, the PDT recommends considering the 999 vessels that do not qualify under Groups 1-4, described in Table 4.

These 999 vessels can be broken down into two groups: 5.1) those that landed at least one trip above the 500 lb incidental limit for wings but never landed more than 25,000 lb in any fishing year (e.g., Group 5.1 in Table 4), and 5.2) those that never landed above the incidental limit (under 500 lb, Group 5.2). The average wing revenue per vessel of Group 5.1 is over 20 times greater than Group 5.2 over FY 2003-2018.

Table 4. Vessels NOT qualifying under draft wing LA permit criteria.

Wing Group	Number of Vessels	FY 2003-2018		
		Live Landings (lb)	Total Revenue	Revenue/Vessel
5.1 (500-25,000 lb)	469	28,753,197	\$7,384,494	\$15,745
5.2 (<500 lb)	530	1,488,778	\$384,298	\$725
5 (Total Non-qualifiers)	999	30,241,975	\$7,768,792	\$7,776

Analysis of Potential Wing Landings with FY 2020 Possession Limits: In April 2017, the Skate Committee tasked the PDT to review “whether or not there is justification for limited access for each of the two fisheries.” In the March 11, 2020 PDT memo, the PDT provided an example of the potential landings at the current (FY 2020) possession limits to better fulfil this task. It is briefly described here. Qualifiers were examined using the landings for wings (consistent with the possession limits). The above vessel groups were used. Groups 1a through 4b (8 groups) annualized landings for the 16-year period were summed (from Table 5) and converted to landed weight, equaling 11,401,837 landed pounds (live weight divided by 2.27). This equals 99% of the FY 2020 wing TAL (11,536,874 landed pounds (11,879 mt * 2204.622, from Figure 1, divided by 2.27).

If all 469 vessels in Group 5.1 landed one trip at the wing possession limit in each season, the total landings by that group would be 3.75M pounds. If each of the 530 vessels in Group 5.2 had one trip at the incidental limit, the group would land 265,000 pounds.

Thus, the total potential landings under this example would be 15.4M lb., far exceeding the 11.5M lb TAL.

Alternatively, the number of trips at the wing possession limit by Group 5.1 vessels that it would take to exceed the wing TAL could be examined. Assuming Groups 1a through 4b landed 11.4M lb, there would be 135,038 lb remaining within the TAL:

- In season 1, only 45 trips by any of the Group 5.1 vessels, at the possession limit, would result in the TAL being exceeded (135,038/3,000=45)
- In season 2, only 27 trips by Group 5.1 vessels would result in the TAL being exceeded (135,038/5,000=27)

4.2 DRAFT BAIT CRITERIA - NOT YET APPROVED BY COMMITTEE OR COUNCIL

Bait limited access permit qualification criteria were drafted by members of the Skate Advisory Panel in April 2019 (no quorum at meeting; Table 5). **The Skate Committee has not moved this proposal as an alternative** for Amendment 5 but tasked the PDT with identifying the vessels, landings, and revenue that would fit within these criteria (Table 6).

Table 5. Bait fishery qualification criteria and structure of a limited access program as proposed by AP members present at the April 23, 2019 meeting.

Bait Group	Qualification	Trip Limit
1	LOA prior to CD and active (>1 live lb) 2014 - 2018	25,000 lb
2	Had LOA after CD and ≥50,000 live lb in any 1 year, 2009-2018	10,000 lb
3 (Non-qualifier)	Other	1,200 lb

Note: bait control date is July 30, 2009.

Table 6. Qualifying vessels under draft bait LA permit criteria.

Bait Group	Number of Vessels	Live Landings (lb)	Total Revenue	Revenue/Vessel
1	30	72,987,252	\$6,778,947	\$225,965
2	24	63,406,247	\$6,298,055	\$262,419
3 (Non-qualifier)	330	31,952,626	\$2,819,759	\$8,545

PDT comment: If the Committee wants to develop these qualification criteria further, the PDT recommends considering the 330 vessels that do not qualify under Groups 1 and 2 (described in Table 7). These 330 vessels can be broken down into two groups: 3.1) those that landed at least one trip above the incidental limit for bait, but never totaled over 50,000 landed lb in any fishing year or acquired an LOA, and 3.2) those that never landed bait above the incidental landings (under 1,135 live lb) on a trip in any fishing year. The average bait revenue per vessel of Group 3.1 is over 60 times greater than Group 3.2 over FY 2003-2018.

Table 7. Vessels NOT qualifying under draft bait LA permit criteria.

Bait Group	Number of Vessels	FY 2003-2018		
		Live Landings (lb)	Total Revenue	Revenue/Vessel
3.1 (1,135-50,000 lb)	172	31,455,085	\$2,779,348	\$16,159
3.2 (<1,135 lb)	158	497,541	\$40,411	\$256
3 (Total Non-qualifiers)	330	31,952,626	\$2,819,759	\$8,545

Analysis of Potential Bait Landings with FY 2020 Possession Limits: As with wings described above, here is an example of the potential landings at the current (FY 2020) possession limits. Details are in the March 11, 2020 PDT memo. Qualifiers were examined using the landings in live pounds for bait (consistent with the possession limits). The above vessel groups were used. Following the same calculation as for wings, the historical landings capability of Group 1 and 2 is 9.1M lb. Adding the ‘potential’ bait landings by Group 3.1 (each one of the 172 non-qualifying vessels land one trip at the 25,000 lb possession limit), 4.3M lb yields a total of 13.4 M lb, slightly over the 13.2 M lb bait TAL for FY 2020.

5.0 AFFECTED ENVIRONMENT

5.1 INTRODUCTION

The Affected Environment is described in this action based on valued ecosystem components (VEC), including target species, non-target species, physical environment and Essential Fish Habitat (EFH), protected resources, and human communities. VECs represent the resources, areas and human communities that may be affected by the alternatives under consideration in this amendment. VECs are the focus since they are the “place” where the impacts of management actions occur.

5.2 TARGET SPECIES (NORTHEAST SKATE COMPLEX)

The following species of skates comprise the NE skate complex: winter skate, barndoor skate, thorny skate, smooth skate, little skate, clearnose skate, and rosette skate.

5.2.1 Species Distribution

Skates are not known to undertake large-scale migrations but move seasonally with changing water temperature, moving offshore in summer and early autumn and returning inshore during winter and spring. Skates lay eggs that are enclosed in a hard, leathery case commonly called a mermaid’s purse. Incubation time is six to twelve months. The young have an adult form at the time of hatching (Bigelow & Schroeder 1953).

Barndoor skate are generally found along the deeper portions of the Southern New England continental shelf and the southern portion of Georges Bank, extending into Canadian waters (<150 - 750 m). The NEFSC surveys catch them far south as NJ during the spring. The survey catches **clearnose** skate in shallower water along the Mid-Atlantic coastline but are known to extend into non-surveyed shallower areas and into the estuaries, particularly in Chesapeake and Delaware Bays. These inshore areas are surveyed by state surveys and the Mid-Atlantic [NEAMAP Survey](#). **Little skate** are found along the Mid-Atlantic, Southern New England, and Gulf of Maine coastline, in shallower waters than barndoor, rosette, smooth, thorny, and winter skates. **Rosette** (590-5,905 m), **smooth** (46 - 914 m), and **thorny** skate (20-1,000 m) are typically deep-water species. The survey catches rosette skate along the shelf edge in the Mid-Atlantic region, while smooth and thorny are found in the Gulf of Maine and along the northern edge of Georges Bank. **Winter** skate are found on the continental shelf of the Mid-Atlantic and Southern New England regions, as well as Georges Bank and into Canadian waters. Winter skate are typically caught in deeper waters than little skate (both found typically <90 m), but partially overlap the distributions of little and barndoor skates.

5.2.2 Stock Status

The last benchmark assessment for skate was in 2007 (SAW 44; NEFSC 2007a; b). Because the analytic models did not produce reliable results, the skate fishing mortality reference points and stock status determinations rely on changes in survey biomass indices. *Overfishing* is occurring on a skate species if the three-year moving average of the survey biomass index for a skate species declines by more than the average coefficient of variation (CV) of the survey time series, then fishing mortality is assumed to be greater than F_{MSY} (NEFSC 2007a). A skate species is *overfished* if its survey biomass index is below its biomass threshold reference point ($B_{threshold}$). An overfished determination triggers the need for a rebuilding plan. A skate species is *rebuilt* if its survey biomass index is equal to or greater than its B_{MSY}

proxy. Details about the overfishing reference points and how they were chosen are given in NEFSC (2000).

The fishing mortality reference points are based on changes in survey biomass indices. If the three-year moving average of the survey biomass index for a skate species declines by more than the average coefficient of variation (CV) of the survey time series (Table 8), then fishing mortality is assumed to be greater than F_{MSY} , and it is concluded that overfishing is occurring for that species (NEFSC 2007a). Except for little skates, the abundance and biomass trends are best represented by the fall survey, which has been updated through 2019. Little skate abundance and biomass trends are best represented by the spring survey, which has not been updated through 2020 given only one leg of the spring 2020 survey could be completed due to COVID-19.

Based on survey data updates, only thorny skate remains overfished (Table 8). Details about long term trends in abundance and biomass are in the SAW 44 Report (NEFSC 2007a) and in the Amendment 3 FEIS (Section 7.1.2).

Barndoor: For barndoor skate, the 2017-2019 NEFSC autumn average survey biomass index (2.02 kg/tow) is above $B_{threshold}$ (0.78 kg/tow) and the B_{MSY} proxy (1.57 kg/tow). The 2017-2019 average index is above the 2016-2018 index by 11.4%. It is recommended that this stock is not overfished, and overfishing is not occurring.

Clearnose: For clearnose skate, the 2018 and 2019 NEFSC autumn average biomass index (no data for 2017; 1.05 kg/tow) is above the $B_{threshold}$ (0.33 kg/tow) but below the B_{MSY} proxy (0.66 kg/tow). The 2018 and 2019 two-year average index is below the 2016 and 2018 index by 73.1%. It is recommended that this stock is not overfished, and overfishing is not occurring.

Little: For little skate, the 2017-2019 NEFSC spring average biomass index (5.32 kg/tow) is above the $B_{threshold}$ (3.07 kg/tow) but below the B_{MSY} proxy (6.15 kg/tow). The 2017-2019 average index is above the 2016-2018 average by 13.4%. It is recommended that this stock is not overfished, and overfishing is not occurring.

Rosette: For rosette skate, the 2018 and 2019 NEFSC autumn average biomass index (no data for 2017; 0.050 kg/tow) is above the $B_{threshold}$ (0.024 kg/tow) but below the B_{MSY} proxy (0.048 kg/tow). The 2018 and 2019 two-year average index is above the 2016 and 2018 index by 6.4%. It is recommended that this stock is not overfished, and overfishing is not occurring.

Smooth: For smooth skate, the 2017-2019 NEFSC autumn average biomass index (0.27 kg/tow) is above the $B_{threshold}$ (0.134 kg/tow) and equal to the B_{MSY} proxy (0.27 kg/tow). The 2017-2019 index is about equal to the 2016-2018 index. It is recommended that this stock is not overfished and is rebuilt, and overfishing is not occurring.

Thorny: For thorny skate, the 2017-2019 NEFSC autumn average biomass index (0.18 kg/tow) is well below the $B_{threshold}$ (2.06 kg/tow). The 2017-2019 index is above the 2016-2018 index by 11.4%. It is recommended that this stock is **overfished** but overfishing is not occurring.

Winter: For winter skate, the 2017-2019 NEFSC autumn average biomass index (8.61 kg/tow) is above the $B_{threshold}$ (2.83 kg/tow) and above the B_{MSY} proxy (5.66 kg/tow). The 2017-2019 average index is above the 2016-2018 index by 19.2%. It is recommended that this stock is not overfished, and overfishing is not occurring.

Table 8. Recent survey indices, survey strata used and biomass reference points of skate species.

	BARNDOOR	CLEARNOSE	LITTLE	ROSETTE	SMOOTH	THORNY	WINTER

a. No survey tows completed south of Delaware in spring 2014. Values for 2014 were adjusted for missing strata (Offshore 61-68, Inshore 32, 35, 38, 41, 44) but may not be fully comparable to other surveys which sampled all strata. b. The 2016 spring survey was later than usual. c. No survey tows completed south of Georges Bank in fall 2017. Values either missing or were adjusted for missing strata (Offshore 1-12, 61-76). d. Two-year average due to missing 2017 survey. e. Values were adjusted for missing Offshore strata 30, 34 and 35.

Note: The full value of the fishing mortality calculations are not used in the table, thus, the values used in the calculation are more precise than those in the table.

5.2.3 Uncertainty Buffer

Amendment 3 established the annual catch limit framework currently used to set specifications for the NE Skate Complex (NEFMC 2009). The uncertainty buffer was set at 25% through Amendment 3 but was decreased to 10% through Framework Adjustment 6 (implemented February 2019; NEFMC 2018b). Additional sources of uncertainty have not been identified; see Table 5 in Framework 6 for the full list of the sources of uncertainty, both management and scientific, considered to affect the NE Skate Complex and any improvements made since Amendment 3 was implemented.

5.2.4 Biological and Life History Characteristics

The Northeast Fisheries Science Center (NEFSC) prepared the Essential Fish Habitat Source Documents for each of the seven skate species provide most available biological and habitat information on skates. These technical documents are available at <http://www.nefsc.noaa.gov/nefsc/habitat/efh/> and contain the following information for each skate species in the Northeast complex:

- Life history, including a description of the eggs and reproductive habits
- Average size, maximum size, and size at maturity
- Feeding habits
- Predators and species associations
- Geographical distribution for each life history stage
- Habitat characteristics for each life history stage
- Status of the stock
- A description of research needs for the stock
- Graphical representations of stock abundance from NEFSC trawl survey and Massachusetts inshore trawl survey data
- Graphical representations of percent occurrence of prey from NEFSC trawl survey data

The seven species of the northeast skate complex follow a similar life history strategy but differ in their biological characteristics. A detailed summary of the biological and life history characteristics was in the FEIS for Amendment 3 (NEFMC 2009). Framework 5 (NEFMC 2018a) also contains updated life history information on the seven skate species.

5.2.5 Discards

Discard estimation method: Skate discards are estimated for a calendar year, rather than the fishing year, because they rely on the NMFS area allocation landings tables to expand observed skate discard/kept-all ratios to total based on landings by gear, area, and quarter. The observed D/K-all ratios are derived from the Northeast Fisheries Observer Program and the At Sea Monitoring program data and include both sector and non-sector vessels but are not stratified on that basis. The discard rate is calculated using a three-year average of the discards of skates divided by the landings of all species.

Estimates of total skate catch are sensitive to the discard mortality rate assumption (Table 9) and have direct implications for allowable landings in the skate fisheries. Based on the weighted average discard mortality across gear types (Table 10), dead discards are estimated (Table 11). Data on immediate- and delayed (i.e., post-release) mortality rates of discarded skates and rays is extremely limited. Benoit (2006) estimated acute discard mortality rates of winter skates caught in Canadian bottom trawl surveys, the SSC in 2009 decided to use a 50% discard mortality rate assumption for all skates and gears for setting the Skate ACL, based on this paper.

This mortality rate continues to be used unless research has improved our understanding of discard mortality for the specific skate species in various gear types (Table 9). Mandelman *et al.* (2013) examined the immediate and short-term discard mortality rate of little, smooth, thorny and winter skates in the Gulf of Maine for otter trawl gear. The SSC approved revising the discard mortality rate estimates for little (22%), smooth (60%), thorny (23%) and winter (9%) skates for otter trawl. Knotek (2018) examined the immediate and short-term discard mortality rate of little, winter, and barndoor skates in scallop dredge gear by evaluating reflex impairment and injury indexes. The SSC approved revising the discard mortality rate estimates for only little (48%) and winter skate (34%) for scallop dredge gear based on this study, as the researchers considered the sample size was insufficient for an accurate estimate for barndoor skate. Sulikowski *et al.* (2018) estimated the discard mortality of winter skate in commercial sink gillnets, and SSC approved revising the discard mortality rate estimate for winter skate (14%) for sink gillnet gear based on this study.

Table 9. Assumed and estimated discard mortality rates of the seven skate species by gear type.

Gear Type	Barndoor	Clearnose	Little	Rosette	Smooth	Thorny	Winter
Gillnet	50%	50%	50%	50%	50%	50%	14%
Longline	50%	50%	50%	50%	50%	50%	50%
Otter Trawl	50%	50%	22%	50%	60%	23%	9%
Scallop Dredge	50%	50%	48%	50%	50%	50%	34%

Over the past few decades, skate discards have decreased substantially (Table 11). Between 2013 and 2018, total and dead skate discards peaked in 2014 and have declining since despite no large changes occurring in the distribution of pounds of skate landed in recent fishing years. Total discards for 2018 were 23,000 mt, a decrease by 11% from 2017.

Table 10. Discards (mt) of skates (all species) by gear type from all areas combined, calendar year 1964 – 2018.

Year	Half 1						Half 2						Grand Total
	Line Trawl	Otter Trawl	Shrimp Trawl	Sink Gill Net	Scallop Dredge	Total Half 1	Line Trawl	Otter Trawl	Shrimp Trawl	Sink Gill Net	Scallop Dredge	Total Half 2

5.3 NON-TARGET SPECIES (BYCATCH)

The skate wing fishery is largely an incidental fishery, with a small portion of the fishery directing on skate wings (Section 5.6.1.5); fishing effort is expended targeting more profitable species managed under separate FMPs, e.g. NE multispecies and Monkfish FMPs. These fisheries have ACLs, effort controls (DAS), possession limits, gear restrictions, and other measures that indirectly constrain overall effort on skates. Framework 58 to the NE Multispecies FMP (NEFMC 2019) and Framework 10 of the Monkfish FMP (NEFMC 2017b) have full descriptions of the fishing impacts on trips targeting NE multispecies and monkfish (www.nefmc.org). A small number of trips could be described as targeting skates; bycatch on these trips is limited. Monkfish and dogfish comprise most of this bycatch and are described below.

Section 5.6 further discusses the relationship of the skate fisheries with the NE multispecies and monkfish fisheries. Table 25 has the amount of skate bait and wings landed on various DAS declarations.

NE Multispecies

The Northeast Multispecies FMP manages twenty stocks under a dual management system which breaks the fishery into two components: sectors and the common pool. For stocks that permit fishing, each sector is allotted a share of each stock's ACL that consists of the sum of individual sector member's potential sector contribution based on their annual catch entitlements. Sector allocations are strictly controlled as hard total allowable catch limits and retention is required for all stocks managed under an ACL. Overages are subject to accountability measures including payback from the sector's allocation for the following year. Common pool vessels are allocated a number of days at sea (DAS) and their effort further is controlled by a variety of measures including trip limits, closed areas, minimum fish size and gear restrictions varying between stocks. Only a very small portion of the ACL is allotted to the common pool. For more detail regarding control of fishing effort on NE Multispecies, see Framework 58 to the NE Multispecies FMP.

Monkfish

NMFS implemented the Monkfish FMP in 1999 (NEFMC & MAFMC 1998). The FMP included measures to stop overfishing and rebuild the stocks through several measures: limiting the number of vessels with access to the fishery and allocating DAS to those vessels; setting trip limits for vessels fishing for monkfish; minimum fish size limits; gear restrictions; mandatory time out of the fishery during the spawning season; and a framework adjustment process.

The Monkfish FMP defines two management areas for monkfish (northern and southern), divided roughly by an east-west line bisecting Georges Bank. Monkfish in both management regions are not overfished and overfishing is not occurring. In recent years, the monkfish fishery has fallen far short of reaching its TAL (except for FY 2017 in the NFMA), despite a healthy stock status. In 2017, limited access monkfish vessels were allocated 45.2 DAS, of which 37 could be used in the southern management area (NEFMC 2017b). Additional information on monkfish management is at: <http://www.nefmc.org/management-plans/monkfish>.

Dogfish

Based upon the NEFSC 2018 updated stock assessment, spiny dogfish stock is presently not overfished, and overfishing is not occurring. The spiny dogfish fishery is managed with an ACL, commercial quota, and possession limits (currently 6,000 lb per trip). Like skates, there is a large degree of spatial overlap between spiny dogfish and NE Multispecies trips where dogfish are landed incidentally to groundfish.

5.4 PROTECTED SPECIES

[Section to be completed. See Framework 8 for latest available.]

5.5 PHYSICAL ENVIRONMENT AND ESSENTIAL FISH HABITAT

[Section to be completed. See Framework 8 for latest available.]

5.6 HUMAN COMMUNITIES

This action evaluates the effect management alternatives may have on the economy, way of life, and traditions of human communities. These social and economic impacts may be driven by changes in fishery flexibility, opportunity, stability, certainty, safety, and/or other factors. While social and economic impacts could be solely experienced by individuals, it is more likely that impacts would be experienced across communities, gear types, and/or vessel size classes. Summarized here are the fisheries and human communities most likely to be impacted by the Alternatives under Consideration. Social, economic and fishery information herein helps describe the response of the fishery to past management actions and predicting how the Amendment 5 alternatives may affect human communities. Also, this section establishes a descriptive baseline to compare predicted and actual changes resulting from management. Additional information is contained in Framework 8 (NEFMC 2020d).

MSA Section 402(b), 16 U.S.C. 1881a(b) states that no information gathered in compliance with the Act can be disclosed, unless aggregated to a level that obfuscates the identity of individual submitters. The fishery data in this framework are thus aggregated to at least three reporting units, to preserve confidentiality. Additional standards are applied to reporting the fishing activity of specific states or fishing communities. To report landings activity to a specific geographic location, the landings have been attributed to at least three fishing permit numbers and the landings must be sold to three or more dealer numbers. However, the dealers do not necessarily have to be in the same specific geographic location.

5.6.1 Commercial Skate Fishery

Skates are harvested in two very different fisheries, one for bait and one for human consumption. As bait, skates are used primarily for the American lobster (*Homarus americanus*) fishery, which prefers small, whole skates. The skate bait fishery is more historic and directed relative to the fishery for human consumption, which harvests skates for their wings. Since 2003, with the implementation of the original Skate FMP, if fishing for skate wings with the intent to land over the 500 lb incidental limit, the vessel must also have a Federal limited access permit for either the Northeast (NE) multispecies, monkfish or scallop fishery, and must declare into and use a day-at-sea (DAS) of one of those fisheries.

Bait fishery: Vessels involved in the bait fishery are primarily from Southern New England ports and target little skates (>90%) and, to a much lesser extent, juvenile winter skates (<10%). Juvenile winter skates and little skates are difficult to differentiate due to their nearly identical appearance. Bait skate is primarily landed by trawlers (Table 13), often as a secondary species while targeting monkfish or groundfish.

The bait fishery, based on FY 2010-2018 averages, is largely based out of Rhode Island (primarily Pt. Judith, also Newport, Tiverton, and Block Island) with other ports in Massachusetts (Fall River, New Bedford, Bourne, and Provincetown), Connecticut (New London, Stonington), New York (Long Island), and New Jersey (Belford, Sea Isle City) also active in the directed bait fishery. The directed skate fishery by Rhode Island vessels occurs primarily in Federal waters less than 40 fathoms from the Rhode Island/Connecticut/New York state waters boundary east to the waters south of Martha's Vineyard and Nantucket out to about 69°W. The most landings are caught south of Block Island in Federal waters. Effort on skates increases in state waters seasonally to supply increased market demand from the lobster fishery in the spring through fall. Skates caught for lobster bait are landed whole by otter trawlers and either sold 1) fresh, 2) fresh salted, or 3) salted and strung or bagged for bait by the barrel. Inshore lobster boats usually use 2 – 3 skates per string, while offshore boats may use 3 – 5 per string. Offshore boats may actually “double bait” the pots during the winter months when anticipated weather conditions prevent the gear from being regularly tended. The presence of sand fleas and parasites, water temperature, and anticipated soak time between trips determine the amount of bait per pot. Within the directed

monkfish gillnet fishery, there is also a seasonal gillnet incidental skate fishery, in which mostly winter skates are sold for lobster bait and as cut wings for processing.

Fishermen have indicated that the market for skates as lobster bait has been relatively consistent. Size is a factor that drives the dockside price for bait skates. For the lobster bait market, a “dinner plate” is the preferable size to be strung and placed inside lobster pots. Little and winter skates are rarely sorted prior to landing, as fishermen acknowledge that species identification between little skates and small winter skates is very difficult. Quality and cleanliness of the skate also determine the price paid by the dealer, rather than just supply and demand. The quantity of skates landed in a day has little effect on price, because there has been ready supply of skates available for bait from the major dealers, and the demand for lobster bait has been relatively consistent. Numerous draggers and lobster vessels have historically worked out seasonal cooperative business arrangements with a stable pricing agreement for skates.

Lobster bait usage varies regionally and from port to port, based upon preference and availability (Section 5.6.3). Some lobstermen in the northern area (north of Cape Cod) prefer herring, mackerel, menhaden, and hakes (whiting and red hake) for bait, which hold up in colder water temperatures; however, the larger offshore lobster vessels still indicate a preference for skates and Acadian redfish in their pots. Some offshore boats have indicated they will use soft bait during the summer months when their soak time is shorter. The Gulf of Maine vessels use skates caught by vessels fishing in the southern New England area.

Wing fishery: The other primary market for skates in the region is the wing market, caught mostly in gillnets (Table 13). Larger skates, mostly captured by trawl gear, have their pectoral flaps, or wings, cut off and sold into this market. The fishery for skate wings evolved in the 1990s as skates were promoted as “underutilized species,” and fishermen shifted effort from groundfish and other troubled fisheries to skates and dogfish. Attempts to develop domestic markets were short-lived, and the bulk of the skate wing market remains overseas. Winter, thorny, and barndoor skates are large enough for processing of wings, but due to their overfished status, possession and landing of thorny skates has been prohibited since 2003. Following a rebuilt determination, limited landings of barndoor skate was allowed following FW5 (NEFMC 2018). Winter skate remains the dominant component of the wing fishery, but illegal thorny wings still occasionally occur in landings. The assumed effectiveness of prohibition regulations is thought to be 98% based on recent work that examined port sampling data ([90 day finding for thorny skate](#)). That means 98% or more of the skates being landed for the wing market are winter skates, so regulations for the wing fishery primarily have an impact on that species.

The wing fishery is a more incidental fishery than bait and involves a larger number of vessels located throughout the region. Vessels tend to catch skates when targeting other species like groundfish, monkfish, and scallops and land them if the price is high enough.

The southern New England sink gillnet fishery targets winter skates seasonally along with monkfish. Highest catch rates are in the early spring and late fall when the boats are targeting monkfish, at about a 5:1 average ratio of numbers of skates to monkfish. Little skate is usually caught incidentally year-round in gillnets, as well, and sold for bait. Several gillnetters indicated that they keep the bodies of the winter skates cut for wings and salt them for bait. Gillnetters have become more dependent upon incidental skate catch due to cutbacks in their fishery mandated by both the Monkfish and Multispecies FMPs. Gillnet vessels use 12-inch mesh when fishing for monkfish and catch larger skates. Southern New England fishermen have reported increased catches of barndoor skates in the last few years.

In 2004, dealers started reporting landings by disposition (wing and bait) and the data on landings by disposition have been improving. Landed skate wings are seldom identified by species by dealers. Skate processors buy whole, hand-cut, and/or onboard machine-cut skates from vessels primarily out of Massachusetts and Rhode Island. Because of the need to cut the wings, it is relatively labor-intensive to fish for skates. Participation in the skate wing fishery, however, has recently grown due to increasing restrictions on other, more profitable groundfish species. It is assumed that more vessels land skate wings as an incidental catch in mixed fisheries than as a targeted species.

New Bedford emerged early-on as the leader in production, both in landed and processed skate wings, although skate wings are landed in ports throughout the Gulf of Maine and extending down into the Mid-Atlantic. Today, Chatham is one of the major ports for skate wings and food skate. Skate wings are also landed significantly in Point Judith and New Bedford. Vessels landing skate wings in ports like Portland, ME; Portsmouth, NH; and Gloucester, MA are likely to land them incidentally while fishing for species like groundfish and monkfish.

The current market for skate wings remains primarily an export market. France, Korea, and Greece are the leading importers. There is a limited domestic demand for processed skate wings from the white tablecloth restaurant business. Winter skates landed by gillnet vessels are reported to go almost exclusively to the wing market. Fishermen indicate that dealers prefer large-sized winter skates for the wing market (over three pounds live weight). Bodies from skates landed for the wing fishery are used as bait in the lobster and Jonah crab fisheries.

5.6.1.1 Permits and Vessels

There is only one type of Federal skate permit (endorsement), an open-access permit. Anyone with a valid Federal fishing permit can obtain a Federal skate permit. Doing so enables participation in the Federal skate fishery and land wing or bait, and to land the higher bait possession limit, also needing a Letter of Authorization for bait. Vessels with a Federal skate permit may commercially fish for, possess, or land skate caught in Federal waters.

If a vessel has a Federal fishing permit but does not have a Federal skate permit (endorsement), it must fish for skate in state waters under state regulations. If the landings are sold to a Federal dealer, they are Federal landings and contribute to the Federal quota monitoring.

From FY 2003 to 2019 (data from the last few years may be subject to future corrections), permit activity for skate landings had the following trends (Table 12 to Table 16, Figure 2 to Figure 4):

- The number of Federal fishing permits with a Federal skate permit (endorsement) peaked in FY 2007 (2,686) and has declined by up to 3% annually ever since (2,028 in FY 2019; Table 15).
- The number of Federal skate permits active each year has declined since FY 2011 (567) to 357 in FY 2019 (Table 14).
- Each year, 73-99% of the active vessels have landed only non-bait (wing), 0-4% have landed only bait, and 1-22% have landed non-bait and bait (Table 12).
- The number of vessels landing bait-only or non-bait and bait has generally increased over time, while the non-bait-only vessels have decreased (Table 12, Figure 2).
- The percent of vessels that took at least one trip over the incidental limit has been 50-65% annually (Table 12).
- The number of trawl vessels landing skate wings is greater than that of gillnets each fishing year for FY2003-2019 for all wing vessels; for vessels landing skate wings over the incidental limit at least once throughout the fishing year, the number of gillnet vessels is generally greater than trawl vessels each fishing year since FY 2010 when skate wing possession limits decreased from 10,000 lb/<24 hrs and 20,000 lb/>24 hrs to 5,000 lb/trip (Table 13, Figure 2, Table 23).
- Each year since FY 2008, the number of Federal skate permits exiting the fishery for the last time has been more than the number of new Federal skate permits issued (Table 15).
- The number of new active Federal permits landing skate has generally been <10 annually since FY 2012, mostly landing non-bait (Table 16).
- FY 2016 and 2017, the years in which incidental limits were triggered, were not particularly unusual in terms of permit activity (Table 14, Table 15, Table 16, Figure 2, Figure 3, Figure 4).

Table 12. Federal fishing permits with and without Federal skate permit (endorsements) and relative skate fishery participation, FY 2003-2019.

Source: Total permits from PERMIT database and permit activity from CFERS tables, accessed 04/22/2020. 2019 data are preliminary.

Total Federal Fishing Permits with or without a Federal Skate permit (Endorsement) are all permits which had a Federal Skater permit/endorsement such that they are in the PERMIT database under PLAN "SKT" and permits which landed and sold skate under a Federal permit (i.e., A permit number not equal to "000000") but were not listed as possessing a Federal Skate endorsement at the time of landing. **All Active Federal Permits Landing Skate with or without a Federal Skate Endorsement** are permits which landed and sold at least one lb of skate under a Federal endorsement such that it was recorded in the CFERS database. This includes permits identified in the CFERS database (i.e., landed and sold skate species to a Federal dealer) but were not listed as possessing a Federal Skate endorsement for that specific fishing year. **Non-bait (wing) vessels** are vessels which only landed wings or other disposition codes. **Bait vessels** are vessels which only landed bait. **Non-bait and bait vessels** are vessels which landed both bait and non-bait on a single trip or on separate trips within the fishing year. **All other vessels landing > 1,135 lb** are vessels that landed wing and bait during the fishing year and exceeded this level on at least one trip.

Notes: The bait trips in FY 2005 were grouped into the bait and non-bait vessels to avoid issues with confidentiality. In FY 2010, the incidental limit was implemented: 500 lb for non-bait (1,135 lb whole weight) and 1,135 lb for bait (whole weight). On trips landing both wing and bait, the whole weight calculation was used, and the incidental limit is equal to 1,135 lb.

Table 13. Number of active non-bait (wing) vessels by gear type for all non-bait (wing) landings and for non-bait (wing) landings over 1,135 lb whole weight at least once during the fishing year, FY 2003-2019.

Fishing Year	Active Non-bait (Wing) Vessels					Non-bait (Wing) vessels landing > 1,135 lb at least once

Source: Total permits from PERMIT database and permit activity from CFDERS tables, accessed 04/22/2020. 2019 data are preliminary. These data are from the same dataset and data pull as the non-bait (wing) data presented in Table 12.

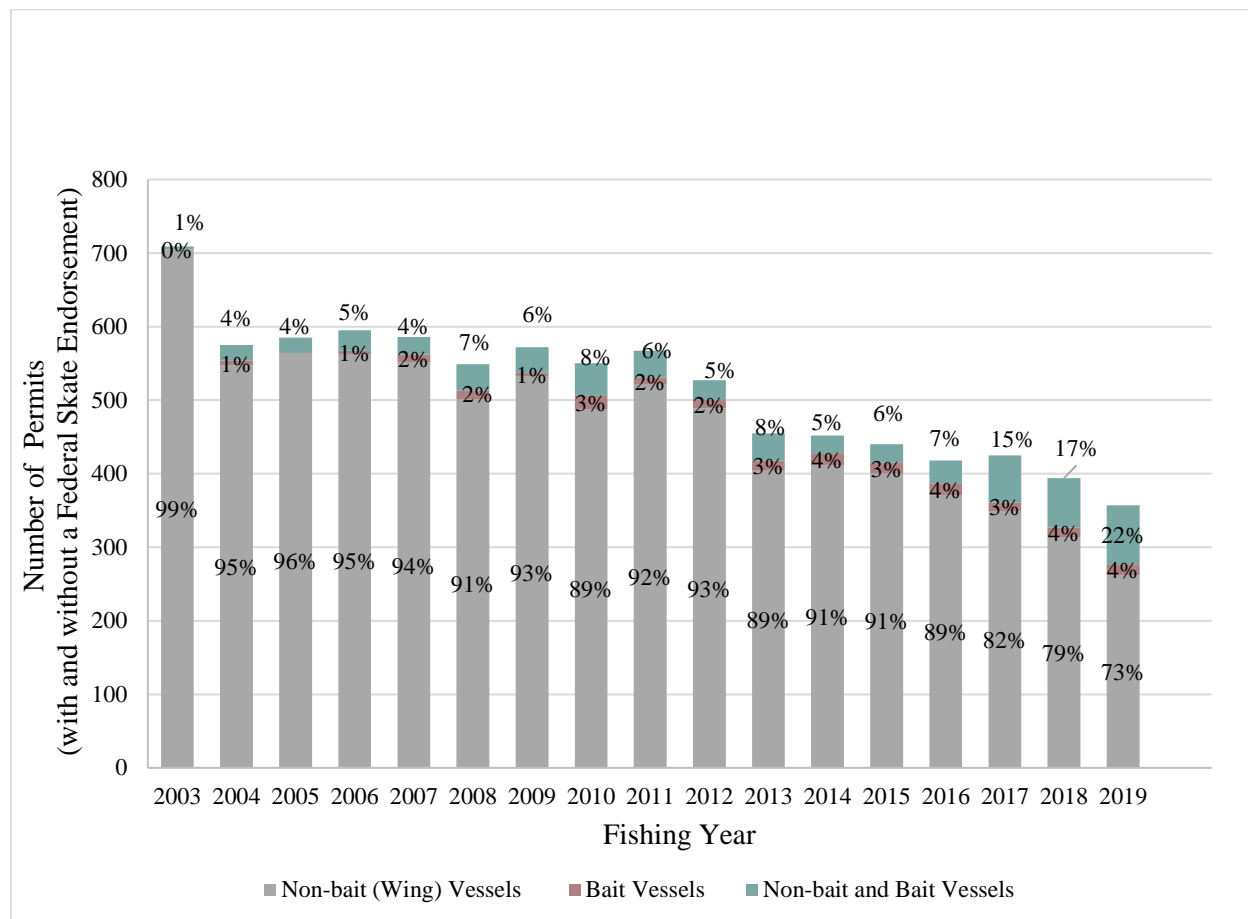

Notes: For all non-bait (wing) vessels, the primary gear was determined using the gear that landed the most skate wings/other (i.e., non-bait) by weight (pounds) during the fishing year. For non-bait (wing) vessels landing over 1,135 lb whole weight at least once, the primary gear was determined using the gear which landed the most wings/other (i.e., non-bait) when only considering the trips landing over 1,135 lb whole weight for each fishing year. Other gear includes all other gear codes that are not trawl or gillnet. In FY 2010, the incidental limit was implemented: 500 lb for non-bait (1,135 lb whole weight) and 1,135 lb for bait (whole weight).

Since 2003, 50% to 65% of the vessels landing skate landed over 1,135 lb whole weight at least once (Table 12, Figure 3). Of these vessels, most landed only non-bait (62-98%). Bait-only vessels and the vessels landing both bait and non-bait comprise a smaller proportion, 0-6% for bait-only and 2-33% for bait and non-bait landings. The number of vessels landing above 500 lb for non-bait (1,135 lb whole weight) and 1,135 lb for bait (whole weight) fluctuates from FY 2003 to 2011, and mostly declines from FY 2011 to 2019. In the latter years in the time series, the proportion of vessels landing above these limits also shifts to higher percentages of bait-only and vessels landing both non-bait and non-bait.

Since FY 2010, there has been a general decline in the number of vessels landing non-bait (wings) above 1,135 lb whole weight at least one time during the fishing year (Table 13). Examining these vessels by gear type, trawl gear comprised an average of 47% of vessels from FY 2003-2009 and 38% from FY 2010-2019. Several regulatory changes occurred in 2010 that could have influenced this reduction in trawl effort. Skate wing possession limits were reduced (Table 23). The groundfish sector program was implemented along with substantial catch limit reductions for some stocks. Though groundfish effort

overall has declined since then, trawl gear has experienced higher decreases relative to other gear types (NEFMC 2020c, Figure 13, p. 51) and Amendment 16 of the Northeast multispecies FMP was expected to impact skate fishing, namely reduce bait skate trawl fishing effort in Southern New England as effort was likely to shift north, where vessels use gillnets to catch skate wings (Skate Amendment 3 FEIS, page 296). See Section 5.6.1.6 for additional data by gear type.

Figure 2. Number of active Federal fishing permits with and without a Federal skate permit (endorsement), FY 2003-2019.

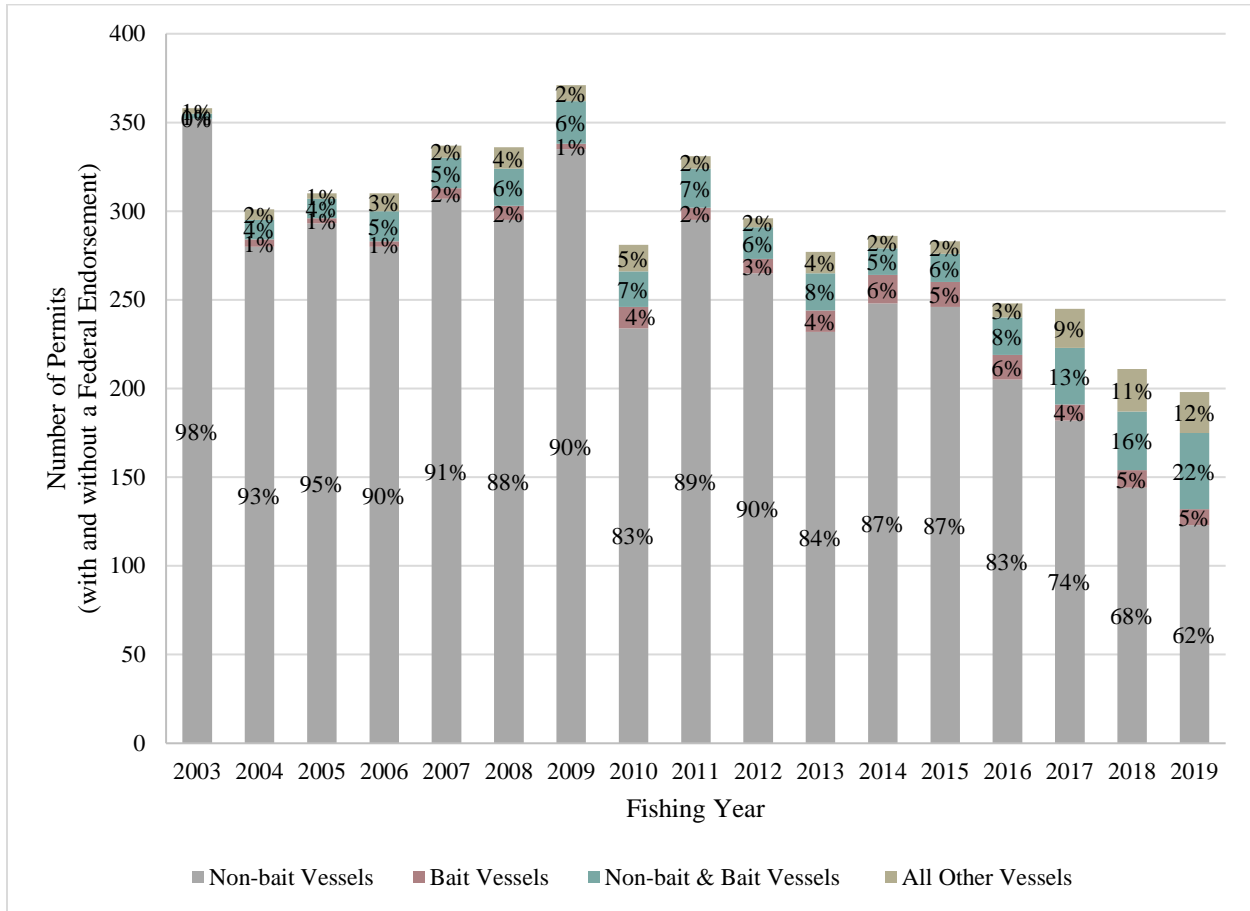

Note: In FY 2005, bait and bait+non-bait vessels were combined to avoid confidentiality issues. Additionally, in cases where the number of permits was three or less, the value was changed to three to avoid confidentiality violations. The years 2003-2006 had sporadic reporting by disposition code. Active permits are vessels that landed skate during that fishing year.

Source: CFDEERS tables, accessed 04/22/2020. 2019 data are preliminary.

The number of active Federal permits landing skate (both with and without a Federal endorsement) follows an overall decreasing trend from FY 2003 to 2019 (Table 12, Figure 2). Most active permits fished solely for non-bait (wings, 73-99%) while bait-only vessels make up a much smaller proportion of active permits (0-4%). Vessels that land both bait and wing comprise 1-22% of the active fleet over the time series. The proportion of non-bait/bait permits increases in the latter half of the time series, jumping from 7% in 2016 to 22% by 2019. Though incidental limits were triggered in FY 2016 and 2017, there are no striking differences in the activity of permits landings skate during this period which could indicate that external factors, such as environmental and or economic, may have played a larger role in the activation of these triggers.

Figure 3. Number and percent of active Federal fishing permits (with and without a Federal Skate Endorsement) landing skates above 1,135 lb whole weight at least once per fishing year, 2003-2019.

Note: Non-bait (wing) vessels are vessels which only landed wings or other disposition codes. Bait vessels are vessels which only landed bait. Non-bait and bait vessels are vessels which landed both bait and non-bait on a single trip or on separate trips within the fishing year. All other vessels landing > 1,135 lb whole weight are vessels that landed wing and bait during the fishing year and exceeded that level on at least one trip.

Note: The bait trips in FY 2005 were grouped into the bait and non-bait vessels to avoid issues with confidentiality. On trips landing both wing and bait, the whole weight calculation was used. In FY 2010, the incidental limit was implemented: 500 lb for non-bait (1,135 lb whole weight) and 1,135 lb for bait (whole weight).

Source: CFDEERS tables, accessed 04/22/2020. 2019 data are preliminary.

Number of new permits with a Federal endorsement are permits identified in the time series for the first time. This does not include permits which exited the fishery and reentered.

The Number of Permits with a Federal Endorsement Exiting the Fishery are permits which were within the fishery in the previous year but were not in the current and future fishing years. This does not include vessels that exited and reentered the fishery, only the final exit of permits is included.

Note: The analysis base fishing year is 2003, such that no change can be calculated from FY 2002-2003.

Source: PERMIT database, accessed 04/22/2020.

All Active Federal Permits Landing Skate with or without a Federal Skate Endorsement defined in the same manner as in Table 12.

New active permit is a permit which entered the fishery for the first time and was active in the specified fishing year.

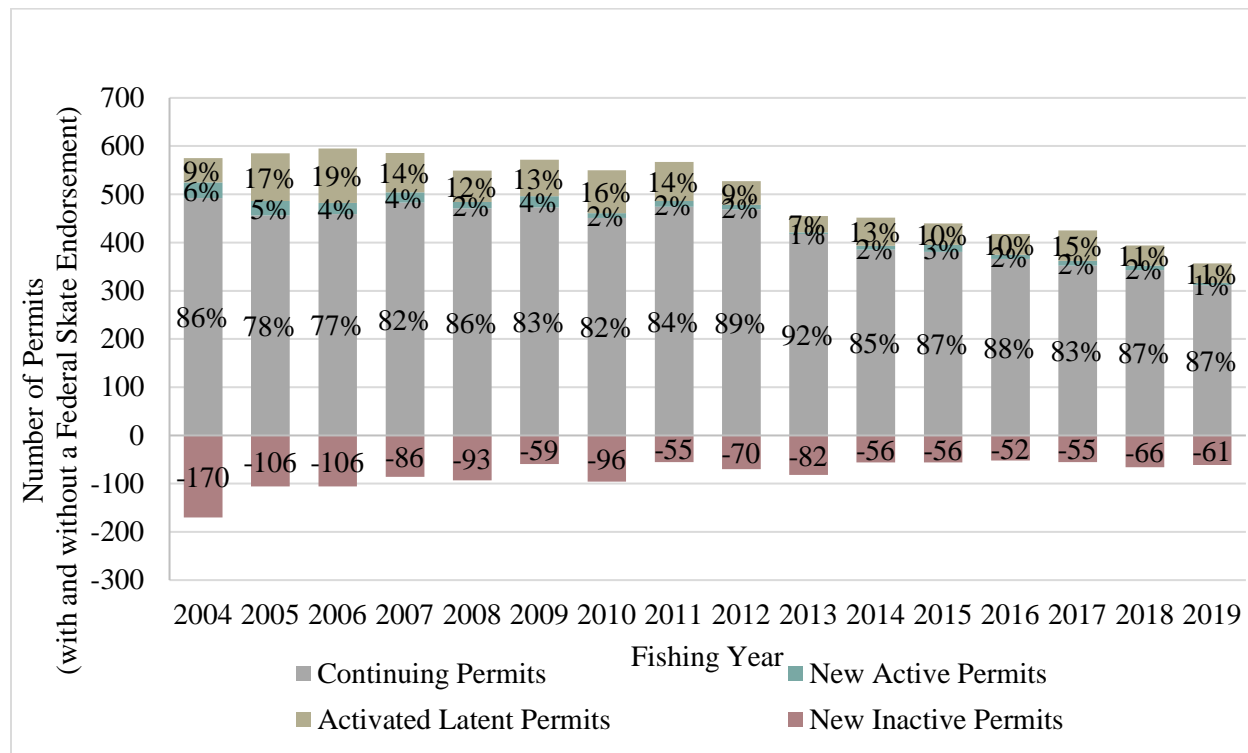

Activated latent permit is a permit that was inactive in previous fishing years but became active in the current fishing year.

Newly inactive permit is a permit that was active in previous fishing years but became inactive in the current fishing year. This does not include permits which exited the fishery entirely.

Notes: The analysis base fishing year is 2003 such that no change can be calculated from FY 2002-2003. Only non-bait vessels are shown as they represent the most fluctuation in permit activity.

Source: Skate permit activity data from CDFERS data tables, accessed on 04/22/2020.

Figure 4. Skate-landing permit (with and without a Federal Skate Endorsement) activity and inactivity by fishing year, 2004-2019.

Note: The positive values are equal to the total number of active permits such that their combined percentages equal 100%. Inactive permits (shown as negative values) are not included in the total percentage of active permits and, therefore, are only represented by the number of newly inactive permits rather than a percentage.

Source: CFDEERS tables, accessed 04/22/2020. FY 2019 data are preliminary.

Overall, the number of active permits in the skate fishery (both with and without a federal endorsement) has declined over the time series, decreasing from 575 to 357 permits from FY 2003 to 2019 (Table 16, Figure 4). Of the active permits, only 1-6% entered the fishery for the first time each year as a “new permit”, leveling off in the latter half of the time series with only 1-3% of permits. The number of permits which became active after being inactive in a previous year fluctuated across the time series, ranging from 7-19% of active permits. An average of 81 permits became inactive in each fishing year, from 52 to 170 newly inactive permits across the time series. This category does not include permits that completely exited the fishery to highlight latent permit activity. The fluctuation in the activity and inactivity of permits demonstrates the variation in annual vessel activity within the skate fishery.

For FY 2018, otter trawl trips were more frequent than gillnet trips overall and for each disposition combination: food only, bait only, food and bait trips (Table 17). Food only trips accounted for the greatest number of trips by a large margin followed by bait only trips, and then food and bait trips. See Section 5.6.1.6 for additional data by gear type.

Table 17. Number of skate trips by disposition and gear, FY2018.

Disposition	Gear Type	Total number of trips

Note: Data only include the disposition codes for bait and wing, not “VTR only,” “Unknown,” or any other codes. These other disposition codes should be analyzed separately because in-season and year-end catch monitoring account for disposition codes differently, especially research and state landings.

5.6.1.2 Catch Limits, Catch and Landings

Skates have been reported in New England fishery landings since the late 1800s. However, commercial fishery landings never exceeded several hundred metric tons until the advent of distant-water fleets during the 1960s (a full description of historic landings is in Amendment 3, NEFMC, 2009).

Methods for In-season Quota Monitoring and Year-end Catch Accounting: During the fishing year, the Greater Atlantic Regional Fisheries Office (GARFO) monitors skate landings against the wing and bait TALs, which are managed in season, and produces weekly landing reports on-line (Table 18). This tally includes skate landings from vessels with a federal fishing permit on the day of landing. Skate landings excluded from TAL monitoring are those by vessels that do not have any federal fishing permits on the day of landing, landings from research, and recreational landings.

At the end of each fishing year, GARFO tabulates skate catches into a few bins and compares the total to the annual catch limit (ACL, Table 19). The “commercial landings” bin includes all skate landings by vessels with a permit number greater than zero. This includes landings by: 1) vessels with a federal fishing permit on the day of landing, 2) vessels with a federal fishing permit at any time of the year, and 3) vessels without a federal fishing permit that year but had one in the past. The “state-permitted only vessel landings” bin includes landings from vessels that never had a federal fishing permit (so the permit # = 0) that were reported to the federal database; the “recreational catch” bin includes landings from private angler and party/charter and dead discards from MRIP; and the “estimated dead discards” bin is based on landings of all species and skate discards on observed trips (Table 19). The year-end calculation of dead discards is estimated on a fishing year basis, with different methods than those used to estimate the calendar year discards for stock assessment and specification setting purposes (Section 5.2.5).

Excluded from the year-end ACL accounting are the vessel-to-vessel skate transfers reported via VTRs (though included in TAL monitoring), skate for personal use/home consumption, and any skate landings by state-only permitted vessels not reported to the federal database but reported by state dealers to the Atlantic Coastal Cooperative Statistics Program (ACCSP) at varying frequencies, updated daily (likely minor, but possible).

NMFS estimates Federal commercial skate landings from the dealer weigh-out database and reports total skate landings according to live weight (i.e., the weight of the whole skate). This means that a conversion factor (most commonly 2.27) is applied to all wing landings so that the estimated weight of the entire skate is reported and not just the wings. While live weight must be considered from a biological and stock assessment perspective, vessel revenue from skate landings are for landed weight (vessels in the wing fishery only make money for the weight of wings they sell, not the weight of the entire skate from which the wings came).

Federal landings are landings made by vessels where permit # is non-zero while state landings are landings from vessels with permit # = 0. Additional information on how state landings are defined, specified, and accounted for in the Skate FMP are included in the March 10, 2021 PDT memo. The March 13, 2020 PDT memo has more information on regulations important to understanding skate fishery data, particularly under what scenarios may skate landings from trips without a Federal declaration (“undeclared”) be permissible. For FY 2018, landings inconsistent with regulations were 224,459 lb (2.4% of total FY 2018 wing landings; March 14, 2020 PDT memo).

In total, the skate fishery caught 20,696 mt in FY 2019, or 66% of the ACL, a large decrease from FY 2018 landings (24,128 mt, Table 19) and an even larger decrease from FY 2017 landings (25,294 mt, Table 19). In FY 2019, the wing fishery caught 82% of its TAL and the bait fishery caught 73% of its TAL (Table 18). State landings in FY 2019 were 174 mt, recreational landings and dead discards were 1,011 mt, and dead discards were 5,962 mt (Table 18).

Total skate landings have fluctuated between FY 2010 and 2019, largely attributable to the wing fishery as landings in the bait fishery have been more stable (Table 20, Figure 5). It is unclear what is driving the trend in wing landings as quota is likely not limiting the fishery. A potential explanation is the decrease in winter skate survey index that suggests fewer winter skate were available to the fishery. Skate landings relative to TALs have also fluctuated during this time. In FY 2016 and 2017, when in-season incidental possession limits were triggered, TALs had been lowered by 23% relative to FY 2014 and 2015. Landings were also lower, but not by that much.

Note that the 2020 Annual Monitoring Report indicated that the “state-permitted only vessel landings” are “landings sold to a federal dealer by vessels without a federal fishing permit at any time during the year...this may include state permitted landings from state-only dealers provided to GARFO from states”. The PDT now understands that this is not accurate. As above, it is the landings from vessels that have never had a federal fishing permit. This clarification will be made going forward.

Table 18. FY 2017 - 2019 in-season monitoring of Northeast skate wing and bait landings.

Disposition	Live Landings		TAL		Percent of TAL Landed

5.6.1.3 Possession Limits

The wing and bait fisheries have differing seasonal possession limits and triggers for when an incidental limit may be implemented under the discretion of the Regional Administrator. If for either skate fishery, at the end of a fishing year, it is calculated that the TAL was exceeded by more than 5%, an automatic adjustment to that fishery’s TAL trigger would occur for the next fishing year. A straight one-for-one percent reduction in a TAL trigger for prior overages reduces the likelihood that future landings would exceed that TAL. This increases the buffer between the TAL and trigger to account for incidental landings in a skate fishery when the skate possession limit declines to the incidental limit. An overage of less than 5% would not be alarming and might be offset by reductions in skate discards.

Current possession limits

In fishing year 2020 and 2021, the bait fishery has three seasons with a 25,000 lb whole weight possession limit (Table 21). The wing fishery has two seasons, with 3,000 lb and 5,000 lb wing weight possession limits. In the wing fishery, if an 85% trigger is reached, the incidental limit will be in place until the end of the season. In the bait fishery, if a 90% trigger is reached in Seasons 1 and 2, or 80% in Season 3, the incidental limit will be in place until the end of the season. In both fisheries, the Regional Administrator has the discretion to not implement, or to later lift, the incidental limit if the full TAL is not expected to be reached.

Table 21. FY 2020 and 2021 skate seasons and possession limits.

Fishery	Season	Dates	Possession Limit	Trigger	Incidental Limit
Wing	1	May 1 – Aug 31	3,000 lb wing weight (6,810 lb whole weight)	85% of seasonal TAL	500 lb wing weight (1,135 lb whole weight)
	2	Sept 1 – Apr 30	5,000 lb wing weight (11,350 lb whole weight)	85% of annual TAL	
Bait*	1	May 1 – Jul 31	25,000 lb whole weight	90% of seasonal TAL	8,000 lb whole weight
	2	Aug 1 - Oct 31		90% of seasonal TAL	
	3	Nov 1 – Apr 30		80% of annual TAL	

Triggering of incidental limit

An incidental limit has been triggered five times (two for bait, three for wing) since first implemented July 2010, out of over 50 seasons of the wing and bait fisheries. The first time was in September 2010 when the wing fishery reached 80% of the wing TAL, triggering the 500 lb incidental limit for about eight months (Table 22). This was due to increased landings of skate wings and a delay in implementing Amendment 3 which reduced the skate wing possession limit to 5,000 lb. The second time the incidental limit was triggered was in October 2016 for the bait fishery in Bait Season 2 for the remainder of that season (about two weeks, Table 22).

Then later in FY 2016 (January 2017), both the wing and bait fisheries reached their respective triggers of 85% (wing) and 90% (bait), so the incidental limit for the third and fourth time was triggered for both fisheries. At the time, the bait incidental limit was tied to the wing incidental limit, meaning 1,135 lb whole weight for bait and 500 lb wing weight for wings. Both fisheries were limited to the wing incidental limit until March 14, 2017. At that time, the RA projected the wing and bait TALs would not be exceeded for the remainder of that fishing year (about one and a half months), so the skate wing possession limit was increased to the full 4,100 lb possession limit, while the bait possession limit was not increased to the full 25,000 lb limit but rather the whole weight wing limit equivalent of 9,307 lb (Table 22).

At the next Council meeting (April 2017, when the Council also received the Amendment 5 scoping comments), the Council initiated Framework 4. Implemented on March 15, 2018, this action lowered the Bait Season 3 possession limit and trigger and de-coupled the triggers of the wing and bait incidental limits, creating an independent incidental possession limit for the bait fishery. Since then, the bait trigger is no longer linked to the wing fishery possession limits.

The fifth (and latest) time an incidental limit was triggered was for the wing fishery in December 2017. It remained in place for most of the rest of the fishing year (about 3.5 months). For the last few weeks of that fishing year, the Regional Administrator returned the fishery to its regular seasonal limit when it was determined that the annual TAL was unlikely to be reached.

Again, at the next Council meeting (January 2018), the Council initiated Framework 6 primarily to minimize the likelihood of the wing fishery incidental possession limit being triggered. See below for more on this action.

Table 22. Dates when the incidental limits have been triggered in the skate fishery.

Fishery	Date	Action
Wing	September 3, 2010	Possession limit reduced from 5,000 to 500 lb (wing weight) when 80% of annual TAL was expected to be reached. Remained in place until the end of the fishing year, April 30, 2011.
Bait	October 18, 2016	Season 2 PL reduced from 25,000 to 9,307 lb (whole weight; equal to the 4,100 landed lb wing limit) when 90% of Season 2 TAL was expected to be reached. Remained in place until the end of Season 2, October 31, 2016.
Wing & Bait	January 30, 2017	WING: Season 2 PL reduced from 4,100 to 500 lb (wing weight) when 85% of annual <u>wing</u> TAL was expected to be reached. Remained in place until March 14, 2017. PL returned to 4,100 lb as RA projected that the wing TAL would not be exceeded.
		BAIT: Season 3 PL reduced from 25,000 to 1,135 lb (wing weight; equal to the 500 landed lb wing limit) when 90% of the annual <u>bait</u> TAL was expected to be reached. Remained in place until March 14, 2017. PL increased to 9,307 lb as RA projected that the bait TAL would not be exceeded.
Wing	December 27, 2017	Season 2 PL reduced from 4,100 to 500 lb (wing weight) when 85% of annual TAL was expected to be reached. Remained in place until April 8, 2018. PL returned to 4,100 as RA projected that TAL would not be exceeded.

Prior possession limits

The wing possession limits for both seasons have remained relatively constant since annual catch limits and accountability measures were implemented in 2010, with seasonal possession limit increases effective beginning in FY 2020 (Table 23).

The bait possession limits have varied since annual catch limits and accountability measures were implemented in 2010, with Season 3 possession limit increases effective beginning in FY 2020 (Table 24). The incidental limit trigger and incidental possession limit have also changed over time. As explained above, the in-season adjustments to possession limits were linked between the bait and wing fisheries through March 15, 2018, which was problematic in FY 2016.

Table 23. Skate wing possession limits by season and fishing year.

FY	Season	Dates	Possession Limit	Barndoor Skate Wing Possession Limit	Incidental Limit Regulations
2003 – Northeast Skate Complex FMP implemented			10,000 lb/ <24 hours (i.e. day) & 20,000 lb/ > 24 hours (i.e. trip)		
FY 2009	No season	May 1–Apr. 30	10,000 lb/ <24 hours (i.e. day) & 20,000 lb/ > 24 hours (i.e. trip)	0	
FY 2010	No season	May 1–Jul. 16	10,000 lb/ <24 hours (i.e. day) & 20,000 lb/ > 24 hours (i.e. trip)		
		Jul. 16–Sep. 3	5,000 lb		500 lb (if 80% of wing TAL is landed)
		Sep. 3–Apr. 30	500 lb		
FY 2011	No season	May 1–May 17	5,000 lb		
	1	May 17–Aug. 31	2,600 lb		
	2	Sept. 1–Apr. 30	4,100 lb

		2	Sept. 1 – Jan. 29	4,100 lb	
		3	Jan. 30 – Mar. 13	500 lb	
FY 2017	2	1	May 1 – Aug. 31	2,600 lb	
		2	Sept. 1 – Dec. 26	4,100 lb	
		3	Dec. 27 – Apr. 8	500 lb	*
		4	Apr. 9 – Apr. 30	4,100 lb	1,025 lb
FY 2018 - 2019	1	May 1 – Aug. 31	2,600 lb	650 lb	
	2	Sept. 1 – Apr. 30	4,100 lb	1,025 lb	
FY 2020	1	May 1 – Aug. 31	3,000 lb	750 lb	
	2	Sept. 1 – Apr. 30	5,000 lb	1,250 lb	

*From February 13 – April 8, 2018 the barndoor skate possession limit was 125 lb due to the soft closure.

Table 24. Skate bait possession limits by season and fishing year.

FY	Season	Dates	Possession Limit	Incidental Limit Regulations
2003 – Northeast Skate Complex FMP implemented, Skate Bait LOA requirement				
FY 2010 - 2011	1	May 1 – Jul. 31	20,000 lb	5,902 lb (Season 1) and 9,307 lb (Season 2) (if 90% of bait season’s TAL or annual TAL is landed) or 1,135 lb (if 85% of wing TAL is also landed) ¹
	2	Aug. 1 – Oct. 31		
	3	Nov. 1 – Apr. 30		
FY 2012 - 2015	1	May 1 – Jul. 31	25,000 lb	
	2	Aug. 1 – Oct. 31		
	3	Nov. 1 – Apr. 30		
FY 2016	1	May 1 – Aug. 31	25,000 lb	
		2	Sep. 1 – Oct. 17	
	3	Oct. 18 – Oct. 31	9,307 lb	
		Nov. 1 – Jan. 29	25,000 lb	
		Jan. 30 – Mar. 13	1,135 lb	
		Mar. 14 – Apr. 30	9,307 lb	
FY 2017	1	May 1 – Jul. 31	25,000 lb	
		2		Aug. 1 – Oct. 31
	3	Nov. 1 – Mar. 14	25,000 lb	
		Mar. 15 – Apr. 30	12,000 lb	8,000 lb (if 80% of bait TAL is landed in a season)
FY 2018 - 2019	1	May 1 – Jul. 31	25,000 lb	8,000 lb (if 90% of bait TAL is landed in a season)
	2	Aug. 1 – Oct. 31		
	3	Nov. 1 – Apr. 30	12,000 lb	8,000 lb (if 80% of bait TAL is landed in a season)
FY 2020 - 2021	1	May 1 – Jul. 31	25,000 lb	8,000 lb (if 90% of bait TAL is landed in a season)
	2	Aug. 1 – Oct. 31		
	3	Nov. 1 – Apr. 30		8,000 lb (if 80% of bait TAL is landed in a season)
¹ The bait fishery was only held to the wing incidental limit if BOTH the bait AND wing triggers were reached. If only the wing fishery trigger was reached, the bait fishery would still operate at normal limits until it hits its 90% trigger.				

5.6.1.4 Declarations

In the years FY 2012, FY 2015, FY 2017, and FY 2018, most of the skate wing landings were either from declared Northeast multispecies trips (41-49% of wing landings) or from declared monkfish trips (36-45% of wing landings) followed by undeclared trips (6-15% of wing landings; Table 25; [March 14, 2020 PDT memo](#)). Most skate bait landings were from declared Northeast multispecies trips (29-63% of bait landings) and on undeclared trips (20-44% of bait landings).

Potential source data errors. In examining the data from undeclared trips closely, the PDT has discovered that there are likely errors in the source data ([March 14, 2020 PDT memo](#), Section 4.1):

1. There are trips in which the landings disposition code is likely miscoded, i.e., trips in which the landings were recorded as wing but are more likely to be bait (the lower price is more akin to expected bait prices and landed and live weight are equivalent).
2. There are trips in which the wing landed weight is greater than the live weight.

The magnitude of these potential data errors is small relative to the total undeclared landings (e.g., 0.9% in FY 2017; 0.1% in FY 2018 for the undeclared data). Thus, a minor weight of undeclared landings that were likely bait may be accounted for under the wing TALs.

Undeclared wing landings over the incidental limit. In October, the Committee was concerned that the FY 2017 draft data provided was showing that there was a large weight (850,084 lb) of wing landings on undeclared trips over the incidental limit. Correcting the data query method reduced this number to 584,936 lb ([March 14, 2020 PDT memo](#), Section 5). Removing trips by vessels with a Federal fishing permit but no Federal endorsements (potentially fishing with state fishing permits) and potential data errors reduced the number further to 205,936 lb (2.4% of total FY 2017 wing landings,). These landings are inconsistent with regulations and occurred from 128 trips landing 504-5,372 lb each trip by 35 unique permit numbers (three permits account for most of these trips). For FY 2018, landings similarly inconsistent with regulations were 224,459 lb (2.4% of total FY 2018 wing landings).

Wing landings exceeding possession limits. In October, the Committee was concerned about the number of trips in the FY 2017 draft data that appeared to have wing landings exceeding possession limits. Correcting the data query method (duplicate trips and doubled landings removed) has reduced the number of trips and the weight of overage ([March 14, 2020 PDT memo](#), Section 6), though comparison is difficult, because the data provided in October were not presented by season and excluded some trips. With the query method corrections, total wing landings (all declaration codes) that exceed the seasonal possession limits were under 300,000 lb (65 vessels, 155 trips) in FY 2017 and under 200,000 lb (20 vessels, 113 trips) in FY 2018. However, this includes potentially miscoded data and skate landings by

vessels with a Federal fishing permit but no Federal endorsement. Accounting for all potential data issues (including miscodings) for undeclared landings with a Federal endorsement, the weight more than possession limits is about 7,000 and 18,000 lb in FY 2017 and 2018, respectively.

5.6.1.5 Revenue and Dependence on Skates

Skate revenue was \$5.1-\$9.1M annually from FY 2010 to 2019 (Table 26). The fluctuations in skate revenue are largely due to changes in wing revenue and landings, ranging from \$4.0-7.8M annually. Revenue from the skate bait fishery is much lower and fluctuates less, \$1.1-1.8M annually. Total revenue peaked in FY 2011; the wing fishery had its top revenue year in FY 2014, while the bait fishery had its top year in FY 2011.

Table 26. Skate wing and bait landings (live and landed lb) and revenue, FY 2010 – 2019.

FY	WING			BAIT			Total \$
	Landings		Revenue (\$)	Landings		Revenue (\$)	
	Live lb	Landed lb		Live lb	Landed lb		
2010	21,058,265	9,811,682	4,850,094	9,683,262	9,343,208	1,161,771	\$6.0M

Note: * data are preliminary
Source: CFDETT/CFDETS, July 2020.

Total revenue from vessels that landed at least 1 lb of skate over the course of the fishing year was \$170M in FY 2018, which includes all species' revenues from trips that do and do not land skates if one trip landed skates at one point during the year (Table 27, sum of revenue from all dispositions). The total revenue from vessels that landed at least 1 lb of skate on each trip was \$54M in FY 2018, which includes all species' revenues on trips that landed at least 1 lb of skate (Table 28).

Revenue by Disposition. Given the diversity of participation in the skate fishery, revenue dependence for vessels landing at least 1 lb of skate in a FY is summarized by vessels that land only skate for bait, for food, or skate for bait and food. Within each of these disposition categories, vessels were further divided by those with ≤ or > than 10% of their revenue from skate to understand the importance of skate throughout the fishing year. For vessels landing skate for bait and food in a FY, there are trips where skate is landed for only food, only bait, or both. During FY 2018, 305 vessels (247+58) landed skate for food only, 15 (11+4) vessels landed bait, and 68 vessels (40+28) landed skate for both food and bait (Table 27).

As of July 2020, data for FY 2018 is the latest available from the data source (FY 2019 data are preliminary) and is provided here along with FY 2016 and FY 2017 for comparison (Table 27). There are two years that an in-season incidental possession limit was triggered (Jan 30 – April 30 in FY 2016,

December 27 – April 8 in FY 2017; Table 23); despite that, the dependence data for FY 2016 and 2017 are like FY 2018.

Food only: For the 305 vessels that landed skate for food only in FY 2018, the 247 vessels with $\leq 10\%$ of their annual fishing revenues from skate for food had very low dependence (0.7%, Table 27). The 58 vessels with $>10\%$ revenue from skate had higher revenue dependence, averaging 34% or \$51,727 per vessel. This group had the highest absolute level of skate for food revenues, \$3M. From FY 2016-2018, the number of vessels and total revenue for vessels with skate revenue $\leq 10\%$ of a vessel's annual revenue decreases from 307 to 247 vessels and from \$163M to \$140M (Table 27).

Bait only: For the 15 vessels that landed only skate bait during FY 2018, the 11 vessels with $\leq 10\%$ of their annual fishing revenues from skate bait had very low revenue dependence, 2.2% on average (Table 27). The four vessels with $>10\%$ revenue from skate, had much higher revenue dependence, averaging 39% or \$204,700 (\$51,175 per vessel). From FY 2016-2018, the number of vessels remained relatively stable for vessels with skate revenue \leq and $> 10\%$ of vessel's revenue; however, total revenue increased from \$395K to \$523K for vessels with skate revenue $> 10\%$ of vessel's annual revenue (Table 27).

Bait and food: For the 68 vessels that landed skate for both food and bait during FY 2018, the 40 vessels with $\leq 10\%$ of their annual fishing revenues from skate, had very low dependence on both bait (1.5%) and food (1.2%, Table 27). The 28 vessels with $>10\%$ revenue from skate had important amounts from bait (12.2%) and food (23.1%), for a total of 34% of their revenues depending on skate. Note that the vessels with $>10\%$ revenue from skate had the highest absolute level of revenue from skate bait, \$0.88M. The number of vessels with skate revenue \leq and $> 10\%$ of vessel's annual revenue increased; total revenue also increased (\$8.9M in FY 2016 to \$11.7M in FY 2018 for vessels with $\leq 10\%$ from skate revenue (Table 27). For vessels with skate revenue comprising $>10\%$ of annual revenue, the number of vessels and total revenue remained relatively stable over the period, except that 28 vessels appear in the Bait and Food group in FY 2018 only.

5.6.1.6 Skate Landings by Gear and Landings of Other Species

Trips landing skate

The following examines landings from vessels that landed at least 1 lb of skate on a trip, \$54.1M total in FY 2018 (Table 28). Table 28 includes all landings and revenue for trips with 1+ lb of skate landings by food only, bait only, and food and bait and by gear type (gillnet, otter trawl, and other). See Section 5.6.1.1 for additional data by gear type.

The largest skate landings are by otter trawl in the bait only fishery, 10.0M lb, followed by gillnet in the food only fishery, 8.3M lb (Table 28, top section). The largest amount of all landings on trips landing 1+ lb of skates is by otter trawl in the food only fishery, at 28.0M, or almost half the grand total. In terms of percentage of landings, skates and monkfish comprise the majority of landings with gillnet gear in the food only fishery (Table 28, top section). Monkfish comprises $>50\%$ of landings on trips where skates are landed for both food and bait, however, trips where skates are landed as both food and bait are low volume overall. For revenue in the food only fishery, skates and monkfish comprise most of the revenue in the gillnet fishery, while loligo squid, scup, and whiting contribute the most in the otter trawl, which comprises the greatest revenue for all species, \$37.5M (Table 28, bottom section). Other important species on trips where at least 1 lb of skate is landed in terms of landings and revenue are whiting, fluke, and loligo (not groundfish or scallops).

Table 27. Vessels landing 1+ lb of skate on at least one trip by dependence on total revenue from all species and dependence on skate revenue by disposition, FY 2016-2018.

<i>Source: CFDETT/CFDETS, July 2020.</i>							

During FY 2018, gillnets accounted for over twice as much skate revenue as otter trawls for all trips landing skate. On trips where skates were landed for food only, gillnets are the overwhelming revenue source, with otter trawls a distant second. Quite the reverse is true of the bait only fishery, where otter trawls accounted for most of the skate revenue. On trips where skates were landed as both food and bait, the pattern is like the food only fishery, though at reduced levels.

Table 28. Landings and revenues from trips landing skate, by disposition, FY 2018.

The 'other' species combines all species not itemized in the tables. The shaded cells represent >10% of the total landings and total revenues, which are calculated as weighted averages, dividing the total species' landings or revenues by the grand total by the group.</p> <p><i>Source:</i> CFDETT/CFDETS 2018-2019, July 2020.</p>									

All trips by vessels that landed skate on at least one trip

To better understand which species are contributing the most to total revenue for vessels landing at least 1 lb of skate in a FY, FY 2018 was further examined (Table 29). Table 29 breaks down revenue data by vessels in which skates constitute \leq or $>$ 10% of their annual revenue and by vessels that land skate as food, bait, or both at least once during FY 2018.

Food only: Monkfish comprised 41% of revenue for vessels with $>$ 10% from skate revenue, followed by dogfish (7%); groundfish comprised a little over 1% (Table 29). For the 247 vessels with \leq 10% of their total revenue from only skate for food, the species dependence is more diverse, with 23% Loligo squid, 21% from the groundfish complex, 15% from other species, and 14% scallops.

Bait only: Fluke and blackback (winter) flounder comprised 49% of revenue for vessels with $>$ 10% from skate revenue (Table 29). For the 11 vessels with \leq 10% of their total revenue from only skate bait, blackback, haddock, fluke, loligo squid, and other species were all important.

Bait and food: Fluke and monkfish comprised 35% of revenue for vessels with $>$ 10% from skate revenue (Table 29). For the 40 vessels with \leq 10% of their total revenue from skates, 29% of their revenue was from Loligo squid, 25% from fluke, and 10% from the groundfish complex.

Table 29. FY 2018 revenue by species and disposition of vessels landing skate at least once during FY.

5.6.1.7 Market and Substitute Goods

[Should add in uses as bait by lobster and crab fishery (also uses herring and other), uses as food. Some content is in Sect. 5.6.3.1]

5.6.1.8 Skate Dealers and Processors

[Should add in number of dealers over time. Where they are located? Are dealers of bait and wing the same?]

5.6.2 Recreational Skate landings

Skates have little to no recreational value and are primarily discarded in recreational fisheries. Between calendar year 2010 and 2018, recreational skate landings have fluctuated, with a high of 307,907 lb (140 mt) in 2015 (Table 30). Landings by species varied by region. In FY 2018, recreational landings (248,353 lb) were 10% of landings and dead discards (2.4M lb, Table 30). Reliability of skate recreational catch estimates is a concern. Total catch estimates (A+B1+B2), however, appear to be more reliable than harvest estimates (A+B1 only). Since skates are not a valuable or heavily fished recreational species, the number of intercepts from which these estimates are derived is likely to have been very low. The fewer intercepts from which to extrapolate total catch estimates there are, the less reliable the total catch estimates will be. Due to the relative absence of recreational skate fisheries, virtually all skate landings are from commercial fisheries.

Table 30. Estimated recreational skate landings by species, 2012-2018.

	Winter (lb)	Clearnose (lb)	Little (lb)	Total (lb)	Total (mt)
2012	2,184	115,168	0	117,352	53
2013	854	88,419	110,771	200,044	91

Note: Species not listed have no reported harvest.

5.6.3 Other Managed Resources and Fisheries

In addition to skates, other fisheries could be impacted by the Alternatives under Consideration. The groundfish and monkfish fisheries are often prosecuted in conjunction with skates and the lobster fishery is dependent on skate as bait.

5.6.3.1 American Lobster Fishery

Population status: The 2015 peer-reviewed stock assessment report (ASMFC 2015) indicated a mixed picture of the American lobster resource. The assessment found the GOM/GBK stock was experiencing

record stock abundance and recruitment (not overfished, not experiencing overfishing), though population indicators show young-of-year estimates are trending downward. This indicates a potential decline in recruitment in the coming years, and the Panel recommended that the ASMFC be prepared to impose restrictions should recruitment decline. Conversely, the assessment found the SNE stock is severely depleted, though overfishing was not occurring, with abundance indices at or near time-series lows. Recruitment indices show the stock has continued to decline and is in recruitment failure.

Management: The Atlantic States Marine Fisheries Commission and NMFS jointly manage lobster. The fishery occurs within the three stock units: Gulf of Maine, Georges Bank, and Southern New England, each with an inshore and offshore component. The fishery is managed using minimum and maximum carapace length; limits on the number and configuration of traps; possession prohibitions on egg-bearing (berried) and v-notched female lobsters, lobster meat, or lobster parts; prohibitions on spearing lobsters; and limits on non-trap landings and entry into the fishery (ASMFC 2015). The most recent addendum, Addendum XVIII, reduces trap allocations by 50% for LCMA 2 and 25% for LCMA 3.

Fishery: The American lobster fishery has seen incredible expansion in effort and landings over the last 40 years and is now one of the top fisheries on the U.S. Atlantic coast. In the 1920s, lobster landings were about 11M lb. Landings were stable from 1950 to 1975, around 30M pounds; however, from 1976 to 2008, landings tripled, reaching 92M pounds in 2006. Landings continued to increase and peaked in 2013 at over 150M pounds. Landings leveled off but remained high at 147M pounds in both 2014 and 2015 (Table 31), but again jumped to over 158M pounds (over \$660 M) in 2016. Recently, most landings have been attributed to Maine (83%) and Massachusetts (11%). Landings, in descending order, also occurred in New Hampshire, Rhode Island, New Jersey, Connecticut, New York, Maryland, Delaware, and Virginia (ASMFC 2018).

Table 31. Total lobster landings (lb) by state, 2009-2015.

	ME	NH	MA	RI	CT	NY	NJ + South ^a	Total

^a "South" includes Delaware, Maryland and Virginia.

In Maine, the fishery is most active during the months of July to November. For the years 2004-2016, about 85% of the pounds landed were landed in those months. Just 4% of landings occurred in the months of January to April (www.maine.gov).

There was an average of 8,315 vessels issued commercial lobster permits for the fishery in state waters each year from 2009 to 2013, and 3,080 vessels were issued federal permits, though in most cases, a vessel holding a federal permit also holds a state permit. Thus, there are about 8,300 vessels in the lobster fishery. The State of Maine has issued the largest number of state permits, recently averaging 5,163 (62%). For Maine, about 85% of the permits are active (~4,400). For New Hampshire, about 70% of the permits issued were active during 2009-2013 ASMFC (2015).

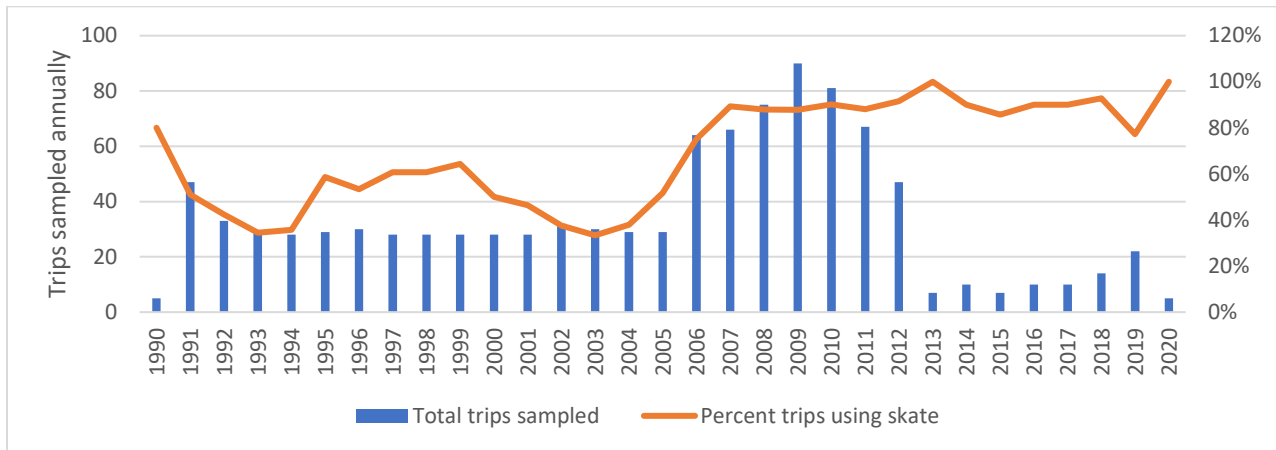

Reliance on skate as bait: Use of skate by the lobster fishery has varied with geography and market conditions. The Maine lobster industry typically prefers herring as bait, though it depends on price and availability. South of Maine, lobstermen tend to use skate or other bait, as herring tends to break down in warmer water. For lobstermen surveyed in 2010 from Maine, New Hampshire and Massachusetts who harvest in Lobster Conservation Management Area A (inshore Gulf of Maine), skate was a minor bait source (Table 32). It is anecdotally known that most of the lobstermen in Rhode Island currently use skates for bait. Though the number of lobster and Jonah crab trips sampled over time has varied, from 1991-2005, the percent of trips where skate was used as bait was generally $\leq 60\%$. Since 2006, skate was a bait source on 75-100% of trips sampled (Figure 6). This suggests that skate has become a more important bait source over time.

Table 32. Bait use in the inshore Gulf of Maine lobster fishery, in 2010.

	Maine							NH	MA

Source: RI DEM, May 2020. Note: 2020 data are for a partial year.

Note: The number of trips sampled was low in 2013-2018 due to staffing limitations.

5.6.3.2 Large Mesh Multispecies (Groundfish)

The overall trend since the start of sector management through 2014 has been a decline in groundfish landings and revenue (\$55M in FY 2014) and the number of vessels with revenue from at least one groundfish trip (273 in FY 2014). The groundfish fishery has had a diverse fleet of vessel sizes and gear types. Over the years, as vessels entered and exited the fishery, the typical characteristics defining the fleet changed as well. The decline in active vessels has occurred across all vessel size categories. Since

FY 2009, the 30' to < 50' vessel size category, which has the largest number of active groundfish vessels, experienced a decline from 305 to 145 active vessels. The <30' vessel size category, containing the least number of active groundfish vessels, experienced the largest reduction since FY 2009 (34 to 14 vessels; Murphy et al. 2015; NEFMC 2017a).

5.6.3.3 Monkfish

Life History. Monkfish, *Lophius americanus*, (i.e., “goosefish”), occur in the western North Atlantic from the Grand Banks and northern Gulf of St. Lawrence south to Cape Hatteras, North Carolina. Monkfish occur from inshore areas to depths of at least 2,953 ft (900 m). Monkfish undergo seasonal onshore-offshore migrations, which may relate to spawning or possibly to food availability. Female monkfish begin to mature at age 4 with 50% of females maturing by age 5 (~17 in [43 cm]). Males generally mature at slightly younger ages and smaller sizes (50% maturity at age 4.2 or 14 in [36 cm]). Spawning takes place from spring through early autumn. It progresses from south to north, with most spawning occurring during the spring and early summer. Females lay a buoyant egg raft or veil that can be as large as 39 ft (12 m) long and 5 ft (1.5 m) wide, and only a few mm thick. The larvae hatch after 1 - 3 weeks, depending on water temperature. The larvae and juveniles spend several months in a pelagic phase before settling to a benthic existence at a size of ~3 in (8 cm; NEFSC 2011).

Population and Management Status. NMFS implemented the Monkfish FMP in 1999 (NEFMC & MAFMC 1998) and NEFMC and MAFMC jointly managed the fishery. The FMP included measures to stop overfishing and rebuild the stocks through measures such as: limiting the number of vessels with access to the fishery and allocating DAS to those vessels; setting trip limits for vessels fishing for monkfish; minimum fish size limits; gear restrictions; mandatory time out of the fishery during the spawning season; and a framework adjustment process.

The Monkfish FMP defines two management areas for monkfish (northern and southern), divided roughly by an east-west line bisecting Georges Bank. As of 2013 data, monkfish in both management areas are not overfished and overfishing is not occurring (NEFSC 2013). Operational assessments for monkfish were conducted in 2016 and 2019, but it was recommended that stock status not be updated during these data updates due to a lack of biological reference points (NEFSC 2020; Richards 2016). According to the 2019 assessment, strong recruitment in 2015 fueled an increase in stock biomass in 2016-2018, though abundance has since declined as recruitment returned to average levels. Biomass increases were greater in the northern area than in the southern area, and biomass has declined somewhat in the south, as abundance of the 2015-year class declined. In the north, landings and catch have fluctuated around a steady level since 2009, but increased after 2015, with discards increasing only slightly. In the south, catch and landings had been declining since around 2000, but catch increased after 2015 due to discarding of a strong 2015-year class, with almost a doubling of the discard rate.

5.6.4 Fishing Communities

Consideration of the economic and social impacts on fishing communities from proposed fishery regulations is required under the National Environmental Policy Act (NEPA) and the Magnuson Stevens Fishery Conservation and Management Act, particularly, National Standard 8 which defines a “fishing community” as “a community which is substantially dependent on or substantially engaged in the harvesting or processing of fishery resources to meet social and economic needs, and includes fishing vessel owners, operators, and crew and United States fish processors that are based in such community” (16 U.S.C. § 1802(17)). Determining which fishing communities are “substantially dependent” on, and “substantially engaged” in a fishery can be difficult. For skates, they are widely used as bait for the

lobster fishery, and it is impractical to identify every community with substantial involvement in the lobster fishery (and consequently some dependence on the skate fishery) for assessment in this document.

Determining the engagement in and reliance on the skate fishery: The NMFS Fishing Engagement and Reliance Indices give a broader view of the degree of involvement of communities in fisheries than simply using pounds or revenue of landed fish (Jepson & Colburn 2013). The indicators portray the importance or level of dependence of commercial or recreational fishing to coastal communities and are used here to help identify primary ports for a fishery. The degree of engagement in or reliance on the skate fishery is based on multiple sources of information, averaged over five-year time periods, using NMFS dealer and U.S. Census data.

- *The engagement index* incorporates the pounds and value of landed skates, the number of Northeast skate commercial fishing permits with that community identified as the homeport, and the number of skate dealers buying fish in that community.
- *The reliance index* is a per capita measure using the same data as the engagement index but divided by total population of the community.

Using a principal component and single solution factor analysis, each community receives a factor score, which is translated into a ranking of low, medium, medium-high, or high. A score of 1.0 or more places the community at 1 standard deviation above the mean (or average) and is considered highly engaged or reliant. Communities with negative scores (i.e., below the mean) have low engagement. More information about the indicators may be found at: <http://www.st.nmfs.noaa.gov/humandimensions/social-indicators/index>.

5.6.4.1 Skate Fishing Communities

5.6.4.1.1 Communities Identified

There are over 400 communities that have been a homeport or landing port to one or more active Northeast skate vessels since 2010 (more homeports than landing ports landing). These ports occur throughout the coastal northeast and mid-Atlantic, primarily from Maine to New Jersey. The level of activity in the skate fishery has varied across time. This section identifies the communities for which skates are particularly important. While the involvement of communities in the skate fishery is described, individual vessel participation may vary. Communities dependent on the skate resource are categorized into primary and secondary port groups. Metrics were calculated using the annual average over a recent nine-year period for which landings data are available, here (FY 2010-2018). Because geographical shifts in the distribution of Northeast skate fishing activity have occurred, the characterization of some ports as “primary” or “secondary” may not reflect their historical participation in and dependence on the skate fishery. The Fishing Engagement and Reliance Indicators of the NOAA Fisheries Community Social Vulnerability Indicators reveal that there are over 480 communities that have a skate fishery engagement and reliance index in the range of low to high, using 2014-2018 data. Reported in Table 33 are the 28 communities that have a ranking of at least medium-high for either engagement or reliance.

Primary Port Criteria. The skate fishery primary ports are those that are substantially engaged in the fishery, and which are likely to be the most impacted by the alternatives under consideration. The primary ports meet at least one of the following criteria:

1. At least \$1M average annual revenue of skates during 2010-2018 (Table 34), or
2. A ranking of high for engagement in and reliance on the skate fishery on average in 2014-2018 according to the NOAA Fisheries Community Social Vulnerability Indicators (Table 33).

Secondary Port Criteria. The skate fishery secondary ports are those that may not be as dependent or engaged in the fishery as the primary ports but are involved to a lesser extent. Because of the size and diversity of the skate fishery, it is impractical to examine each secondary port individually. However, they are listed here to provide a broader scope of potential communities impacted by skate management measures. The secondary ports meet at least one of the following criteria:

1. At least \$100,000 average annual revenue of skates, 2010-2018, or
2. A ranking of at least medium-high for engagement in or reliance on the skate fishery on average in 2014-2018 according to the NOAA Fisheries Community Social Vulnerability Indicators (Table 34).

Skate Primary and Secondary Ports. Based on these criteria, there are eight primary ports in the Northeast skate fishery (Table 35). Of these, the highest revenue ports are Chatham and New Bedford, Massachusetts and Point Judith, Rhode Island. There are 21 secondary ports from Massachusetts to North Carolina. The primary and secondary ports comprised 72% and 24% of total fishery revenue, respectively, during 2010-2018. There are 87 other ports that have had more minor participation (4%) in the fishery recently.

Of the primary ports, Chatham had the highest average revenue between 2010 and 2018, \$1.7M, or 15% of total revenue in Chatham for all fisheries (Table 34). There were 59 active skate vessels during that time. Point Judith and New Bedford each had an average over \$1.2M. The percent of total revenue was lower, just 0.3% and 2.8%, respectively. However, a much larger number of skate vessels landed in these ports, 167 and 178, respectively. Thus, although these three ports are important for the skate fishery, other fisheries dominate their overall fishing activity. For most of the secondary ports, the percent revenue from skates is also very low, from 0.3-12%, except for Sea Isle City, New Jersey (18%). Montauk, New York and Gloucester, Massachusetts had 106 and 152 active skate vessels during 2010-2018, higher than the other secondary ports, 5-96. Community profiles are available from the NEFSC Social Sciences Branch website (Clay et al. 2007).

The Engagement Index can be used to determine trends in a fishery over time. Those ports with high skate engagement in 2014-2018, generally had high engagement in 2004-2008 and 2019-2013, except for Westport, MA; Stonington and New London, CT; and Belford NJ (Table 36). There are 11 ports that have had high engagement during the three periods, indicating a stable presence in those communities.

Table 36. Changes in engagement over time for all primary and secondary skate ports, plus any port with medium-high or high skate engagement over the time series, 2004-2018.

Source: <http://www.st.nmfs.noaa.gov/humandimensions/social-indicators/index>.

Social and Gentrification Pressure Vulnerabilities. The NOAA Fisheries Community [Social Indicators](#) are quantitative measures that describe different facets of social and economic well-being that can shape either an individual's or community's ability to adapt to change. The indicators represent different facets of the concepts of social and gentrification pressure vulnerability to provide context for understanding the vulnerabilities of coastal communities engaged in and/or reliant on commercial fishing activities.

Provided here are these indicators for the primary and secondary skate ports. At least some data are missing for Wainscott and Oak Beach/Captree, NY because these communities are not included in the American Community Survey five-year estimates upon which the social and gentrification pressure vulnerability indicators are based. Therefore, their status in these categories could not be analyzed.

The social vulnerability indicators. There are five social vulnerability indicators: Labor force structure, Housing characteristics, Personal disruption, Poverty, and Population composition. The variables used to construct each of these indices have been identified in the literature as representing different factors that may contribute to a community's vulnerability. The **Labor force structure** index characterizes the strength/weakness and stability/instability of the labor force. The **Housing characteristics** index is a measure of infrastructure vulnerability and includes factors that indicate housing that may be vulnerable to coastal hazards. The **Personal disruption** index represents factors that disrupt a community member's ability to respond to change because of personal circumstances affecting family life such as unemployment or educational level. The **Poverty** index is a commonly used indicator of vulnerable populations. The **Population composition** index shows the presence of populations who are traditionally considered more vulnerable due to circumstances often associated with low incomes and fewer resources. A high rank in any of these indicates a more vulnerable population.

Overall, both primary and secondary skate port communities exhibited medium to high vulnerability in at least one of the five social vulnerability indicators. For primary ports, only New Bedford, MA shows vulnerabilities in more than one of the five indicators. In fact, it has vulnerabilities in four out of the five indicators. For secondary ports, New London, CT and Newport News, VA scored medium to high for four out of the five indicators. For both primary and secondary ports, the most common indicator of vulnerability is Labor force structure.

Gentrification Pressure Indicators. Gentrification pressure indicators (Table 38) characterize factors that, over time, may indicate a threat to the viability of a commercial or recreational working waterfront, including the displacement of fishing and fishing-related infrastructure. The **Housing Disruption** index represents factors that indicate a fluctuating housing market where some fishing infrastructure displacement may occur due to rising home values and rents. The **Retiree migration** index characterizes areas with a higher concentration of retirees and elderly people in the population. The **Urban sprawl** index describes areas with increasing population and higher costs of living. A high rank in any of these indicates a population more vulnerable to gentrification.

All primary skate ports scored medium to high on at least two of the three gentrification pressure indicators. Similar results are found for secondary ports, with 16 out of 21 scoring medium or higher on at least two of the three indicators. This suggests that shoreside fishing infrastructure and fishing family homes may face rising property values (and taxes) from an influx of second homes and businesses catering to those new residents, which may displace the working waterfront.

Combined Social and Gentrification Pressure Vulnerabilities. Overall, five of the eight primary port communities have medium to high levels of vulnerability for four or more of the eight indicators (combined social and gentrification pressure). New Bedford, MA has six indicators at the medium to high level. For secondary ports, 10 of the 21 communities have medium to high levels of vulnerability for four or more of the eight indicators. Boston, MA has five. This indicates high social and gentrification pressure vulnerability overall for both the primary and secondary communities, though some individual communities exhibit low levels for one or more indicators.

Table 37. Social vulnerability in primary and secondary skate ports, 2018.

5.6.4.1.2 Environmental Justice

Executive Order 12898 requires federal agencies conduct their programs, policies, and activities in a manner to ensure individuals or populations are not excluded from participation in, or denied the benefits of, or subjected to discrimination because of their race, color, or national origin. This executive order is generally referred to as environmental justice. Environmental justice is measured at the community level. Here we define a community as a fishing community. Indicators of vulnerability for purposes of environmental justice can include but are not limited to income, race/ethnicity, household structure, education levels, and age. The focus of E.O. 12898 is to consider “the disproportionately high and adverse human health or environmental effects of [an agency’s] programs, policies, and activities on minority populations and low-income populations in the United States and its territories...”

The poverty, population composition, and personal disruption indices (Table 37) can provide useful insights to understanding communities where environmental justice may be of concern. New Bedford, MA was the only primary port and Boston, MA; New London, CT; and Newport News, VA are the only secondary ports that ranked medium to high for all three indices. This was followed by five secondary ports that ranked medium or higher for only one index. The vulnerability characteristics of these communities indicate they may be more vulnerable to changing conditions, due to factors described above as important indicators for environmental justice.

5.6.4.1.3 Ports by fishery (wing and bait)

Wing fishery: During 2010-2018, skate wings (food) were landed in over 115 ports. Skate wing revenue was highest in Chatham and New Bedford, MA; and Point Judith and Little Compton, RI during that time (Table 39). In 2018, the top wing ports were Chatham and New Bedford, MA; Point Judith, RI, and Point Pleasant, NJ. The total skate wing revenue for 2018 (\$5.6M) was slightly lower than the average for 2010-2018 (\$5.8M). The top port for skate wing revenue has been Chatham, averaging \$1.7M for 2010-2018, accounting for 29% of wing revenue. The second highest port for skate wings is now Point Judith, but the revenue in 2018 (\$539K) was down 27% from the nine-year average (\$741K). New Bedford skate wing revenues were \$467K in 2018, much less than half its 2010-2018 average of \$1.2 million.

Trawl and gillnet vessels land skate wings. Some trawlers target skate; others catching skate incidentally. Most of the gillnet vessels targeting skate are based largely in Chatham but also in New Bedford. There is a very small skate wing fleet in Virginia, though it has dramatically declined in recent years. Most of these are monkfish gillnets though some draggers caught skate incidentally at the height of the fishery.

Bait fishery: During 2010-2018, skate bait was landed in over 35 ports with bait revenue highest in Point Judith and Newport, RI during that time (Table 39). In 2018, the top bait ports were Point Judith, RI, and New London, CT. The total skate bait revenue for 2018 (\$1.4M) was slightly higher than the average for 2010-2018 (\$1.3M). The top port for skate bait revenue has been Point Judith, RI, averaging \$554K for 2010-2018, accounting for 43% of bait revenue. The second highest port for skate wings is now New London, CT, with revenue in 2018 (\$280K) up 204% from the nine-year average (\$137K). These revenues are those reported by Federal dealers. Ports such as Montauk, NY have individual vessels which sell skate directly to lobster and other pot fishermen for bait.

Table 39. Skate revenue by disposition and port, for calendar years 2010-2018.

Port	Avg. 2010-2018	2018 only
Wing (food)	\$5,779,373	\$5,617,183
Chatham, MA	\$1,689,116	\$2,793,625
New Bedford, MA	\$1,194,233	\$467,668
Point Judith, RI	\$740,775	\$538,917
Little Compton, RI	\$280,600	\$173,131
Barnegat Light, NJ	\$241,332	\$202,637
Montauk, NY	\$230,277	\$246,397
Newport, RI	\$181,871	\$126,719
Point Pleasant, NJ	\$174,092	\$275,422
Gloucester, MA	\$133,104	\$82,331
Hampton Bay, NY	\$154,923	\$119,707
Stonington, CT	\$124,995	\$126,753
Westport, RI	\$100,355	\$55,057
<i>Other Ports (n=104)</i>	<i>\$533,701</i>	<i>\$408,819</i>
Bait	\$1,291,559	\$1,403,155
Point Judith, RI	\$554,199	\$714,467
Newport, RI	\$229,402	\$144,862
Sea Isle City, NJ	\$148,630	\$0
New London, CT	\$137,160	\$280,434
<i>Other Ports (n=32)</i>	<i>\$222,168</i>	<i>\$263,392</i>
Grand Total	\$7,070,932	\$7,020,338

5.6.4.1.4 Fishery by states

During 2010-2018, skates were landed in ten states, mostly in Massachusetts and Rhode Island (Table 40). The bait fishery is primarily located in Rhode Island, and the wing fishery in Massachusetts. The skate fishery is a small contribution (0.0-2.8%) to overall fishing revenue to these ten states.

Table 40. Skate landings and revenue by fishery and state, calendar year 2010-2018.

	Average revenue 2010-2018				
	Skates			All fisheries	% skates
	Bait	Food	Total		
ME	\$72	\$1,245	\$1,316	\$305,515,928	0.0%
NH	\$5,737	\$12,477	\$18,214	\$25,595,733	0.1%
MA	\$139,232	\$3,304,615	\$3,443,847	\$502,369,095	0.7%
RI	\$785,590	\$1,221,570	\$2,007,160	\$71,733,848	2.8%
CT	\$155,177	\$229,162	\$384,338	\$14,564,035	2.6%
NY	\$156	\$416,687	\$416,843	\$27,840,035	1.5%
NJ	\$204,560	\$494,964	\$699,524	\$159,086,127	0.4%
MD	\$601	\$21,258	\$21,859	\$7,065,590	0.3%
VA	\$435	\$71,943	\$72,378	\$60,801,601	0.1%
NC	\$0	\$5,345	\$5,345	\$18,558,375	0.0%

5.6.4.2 Communities for Other Fisheries

There are several other fisheries that are potentially impacted by this action. Summarized below are the key port communities that are important to each of these fisheries, as identified by the lead management entity for each. Where the management entity has not previously identified the relevant communities, a method was developed through an earlier NEFMC action and explained below. Many ports have coexisting fisheries, including the skate fishery. In all, about 50 communities have been identified as potentially impacted (Table 42). Section 5.6.3 contains more information about these fisheries.

American Lobster: The American lobster fishery is the primary end user of skate bait. Lobster is landed in many port communities on the Atlantic coast. The ASMFC does not identify key ports in the FMP for this fishery. In 2019, 17 of the top 20 ports for lobster landed value were in Maine (primarily Mid-Coast to eastern Maine), with one in New Hampshire and two in Massachusetts (Table 41). For purposes of this action, these 20 top ports are considered the primary lobster ports (Table 41). There are over 200 other ports that are the primary landing port or homeport to lobster vessels in about 15 states. Since about 8,000 state waters-only lobster licenses are issued annually, the fishery likely occurs in many other ports.

Northeast Multispecies: Skates are important incidentally to the commercial groundfish fishery and are a bait source for the recreational bait fishery. There are over 400 communities that have been the homeport or landing port to one or more commercial Northeast groundfish fishing vessels since 2008. Ports highly engaged in the groundfish fishery were identified in Framework 59 and Amendment 23 to the Northeast Multispecies FMP (NEFMC 2020a; b). Primary and secondary ports were identified in earlier actions (e.g., NEFMC 2019). For purposes of this action, the highly engaged ports are considered the primary groundfish ports and others identified are secondary (Table 42).

Monkfish: Skates are important incidentally to the monkfish fishery and are a bait source for the recreational bait fishery. The primary and secondary monkfish ports (Table 42), using data in Framework 10 to the Monkfish FMP, are identified as:

- Primary ports: very high engagement in the fishery (score = 5-20) or having at least \$1M of monkfish revenue on average from 2009-2013.
- Secondary ports: high engagement in the fishery (score = 1-4.99) or having at least \$50K of monkfish revenue on average from 2009-2013.

Table 41. Top 20 (non-confidential) landing ports by lobster revenue, 2019, Maine to New Jersey.

5.6.4.3 Port Descriptions

Described here are the eight fishing communities that are primary ports for the skate fishery (Map 1). Each contains demographic data collected by the U.S. Census, accessed in 2020 at: <https://data.census.gov/cedsci>. Fishery data therein are collected by NMFS, much of which are available on the NEFSC website (NEFSC 2017). Clay *et al.* (2007) has a detailed profile of each port, including important social and demographic information.

Map 1. Primary port communities for the skate fishery, with 2016 their commercial fishing engagement indicators.

Source: NOAA Fisheries Social Indicators of Fishing Communities (2020): <https://www.st.nmfs.noaa.gov/data-and-tools/social-indicators/>.

5.6.4.3.1 Massachusetts Ports

Chatham

General: Chatham is a fishing community in Barnstable County, Massachusetts. In 2017, Chatham had an estimated population of 6,149, a 0.4% increase from the year 2010 (6,125). In 2017, 5% of the civilian employed population aged 16 years and over worked in agriculture, forestry, fishing, hunting, and mining occupations in Chatham; the poverty rate was 10%; and the population was 92% white, non-Hispanic.

The commercial fishing engagement and reliance indices for Chatham in 2016 were both high. In 2019, Chatham was the homeport and primary landing port for 90 and 96 Federal fishing permits (i.e., vessels), respectively. Total landings in Chatham were valued at \$16M, 2% of the state-wide total (\$680M), landed by 162 vessels and sold to 36 dealers. American lobster (\$4.3M) was the highest valued species, accounting for 27% of the total Chatham revenue, landed by 40 vessels and sold to 14 dealers (Table 43). The Chatham Fish Pier is an active offloading facility in Chatham. The Cape Cod Community Supported Fishery is based in West Chatham.

Skate fishery: Chatham is a primary port for the skate fishery, with an average revenue of \$1.7M/year from 2010-2018 (highest of all ports), 15% of total revenue in Chatham during that time (Table 34). This

revenue has been primarily from skate wings (Table 39). Skate fishing engagement and reliance indices on average in 2014-2018 were both high (Table 33), and engagement has been high since 2004 (Table 36). In 2019, there was \$2.0M in “big skate” revenue (likely winter skate), landed by 27 vessels and sold to 5 dealers and it was the third highest species landed by value in Chatham (Table 43).

Table 43. Top five species landed by value in Chatham MA, calendar year 2019.

Species	Nominal revenue (\$)	Vessels	Dealers
American lobster	\$4.3M	40	14
Sea scallops	\$2.3M	19	11
Big skate (likely winter skate)	\$2.0M	27	5
Spiny dogfish	\$1.3M	32	3
Softshell clam	\$0.8M	6	10
<i>Note:</i> Data are preliminary.			
<i>Source:</i> NEFSC dealer data, accessed March 2020.			

New Bedford

General: New Bedford is a fishing community in Bristol County, Massachusetts. In 2017, New Bedford had an estimated population of 95,125, a 0.06% increase from the year 2010 (95,072). In 2017, 2% of the civilian employed population aged 16 years and over worked in agriculture, forestry, fishing, hunting, and mining occupations in New Bedford; the poverty rate was 23%; and the population was 64% white, non-Hispanic, 20% Hispanic or Latino, and 5% Black or African American alone.

The commercial fishing engagement and reliance indices for New Bedford in 2016 were high and medium, respectively. In 2019, New Bedford was the homeport and primary landing port for 243 and 262 Federal fishing permits (i.e., vessels), respectively. Total landings in New Bedford were valued at \$451M, 66% of the state-wide total (\$680M), landed by 483 vessels and sold to 76 dealers. Sea Scallop (\$379M) was the highest valued species, accounting for 84% of the total New Bedford revenue, landed by 316 vessels and sold to 32 dealers (Table 44).

Skate fishery: New Bedford is a primary port for the skate fishery, with an average revenue of \$1.2M/year from 2010-2018 (3rd highest of all ports), 0.3% of total revenue in New Bedford during that time (Table 34). This revenue has been primarily from skate wings (Table 39). Skate fishing engagement and reliance indices on average in 2014-2018 were high and medium, respectively (Table 33), and engagement has been high since 2004 (Table 36).

Table 44. Top five species landed by value in New Bedford MA, calendar year 2019.

Species	Nominal revenue (\$)	Vessels	Dealers
Sea scallop	\$379M	316	32
American lobster	\$13M	56	17
Atlantic surfclam	\$7.4M	16	6
Jonah crab	\$6.1M	26	8
<i>Note:</i> Data are preliminary; data for one of the five top species landed are confidential.			
<i>Source:</i> NEFSC dealer data, accessed March 2020.			

5.6.4.3.2 Rhode Island Ports

Little Compton

General: Little Compton is a fishing community in Newport County, Massachusetts. In 2017, Little Compton had an estimated population of 3,521 an 18% increase from the year 2010 (2,879). In 2017, 2% of the civilian employed population aged 16 years and over worked in agriculture, forestry, fishing, hunting, and mining occupations in Little Compton; the poverty rate was 8.5%; and the population was 95% white, non-Hispanic.

The commercial fishing engagement and reliance indices for Little Compton in 2016 were both medium. In 2019, Little Compton was the homeport and primary landing port for 5 and 0 Federal fishing permits (i.e., vessels), respectively. Total landings in Little Compton were valued at \$3.4M, 3% of the state-wide total (\$108M), landed by 29 vessels and sold to 15 dealers. Monkfish (\$1.1M) was the highest valued species, accounting for 32% of the total Little Compton revenue, landed by 29 vessels and sold to 15 dealers (Table 45).

Skate fishery: Little Compton is a primary port for the skate fishery, with an average revenue of \$0.28M/year from 2010-2018 (5th highest of all ports), 12% of total revenue in Little Compton during that time (Table 34). This revenue has been primarily from skate wings (Table 39). Skate fishing engagement and reliance indices on average in 2014-2018 were both high (Table 33), and engagement has been high since 2004 (Table 36). In 2019, there was \$0.34M in “big skate” revenue (likely winter skate), landed by 11 vessels and sold to 3 dealers and it was the fourth highest species landed by value in Little Compton (Table 45).

Table 45. Top five species landed by value in Little Compton RI, calendar year 2019.

Species	Nominal revenue (\$)	Vessels	Dealers
Monkfish	\$1.1M	15	4
Lobster	\$0.62M	7	5
Jonah crab	\$0.42M	6	5
Big skate (likely winter skate)	\$0.34M	11	3
Black sea bass	\$0.19M	13	4

Note: Data are preliminary.

Narragansett/Point Judith

General: Point Judith is a fishing community in the town of Narragansett, in Washington County, RI. In 2017, Narragansett had an estimated population of 15,601, a 2% decrease from the year 2010 (15,868). In 2017, 2% of the civilian employed population aged 16 years and over worked in agriculture, forestry, fishing, hunting, and mining occupations in Narragansett; the poverty rate was 18%; and the population was 94% white, non-Hispanic.

The commercial fishing engagement and reliance indices for Narragansett/Point Judith in 2016 were high and medium, respectively. In 2019, Narragansett and Point Judith were the homeport and primary landing port for 138 and 153 Federal fishing permits (i.e., vessels), respectively. Total landings in Point Judith were valued at \$66M, 60% of the state-wide total (\$108M), landed by 238 vessels and sold to 51 dealers. Sea scallop (\$20M) was the highest valued species, accounting for 30% of the total Point Judith revenue, landed by 49 vessels and sold to 15 dealers (Table 46).

Skate fishery: Point Judith is a primary port for the skate fishery, with an average revenue of \$1.3M/year from 2010-2018 (2nd highest of all ports), 2.8% of total revenue in Point Judith during that time (Table 34). This revenue has been from skate wings (57%) and bait (42%, Table 35). Skate fishing engagement

and reliance indices on average in 2014-2018 were both high (Table 33) and engagement has been high since 2004 (Table 36).

Table 46. Top five species landed by value in Point Judith RI, calendar year 2019.

Species	Nominal revenue (\$)	Vessels	Dealers
Sea scallop	\$20M	49	15
Lologo squid	\$19M	87	16
Lobster	\$5.2M	54	9
Summer flounder	\$4.8M	120	16
Silver hake	\$3.4M	79	13

5.6.4.3.3 New York Ports

Montauk

General: Montauk is a fishing community on Long Island, New York. In 2017, Montauk had an estimated population of 3,662, a 14% increase from the year 2010 (3,157). In 2017, 4% of the civilian employed population aged 16 years and over worked in agriculture, forestry, fishing, hunting, and mining occupations in Montauk; the poverty rate was 5.4%; and the population was 86% white, non-Hispanic.

The commercial fishing engagement and reliance indices for Montauk in 2016 were both high. In 2019, Montauk was the homeport and primary landing port for 120 and 130 Federal fishing permits (i.e., vessels), respectively. Total landings in Montauk were valued at \$18M, 15% of the state-wide total (\$124M), landed by 133 vessels and sold to 39 dealers. Loligo squid (\$4.5M) was the highest valued species, accounting for 30% of the total Montauk revenue, landed by 30 vessels and sold to 19 dealers (Table 47).

Skate fishery: Montauk is a primary port for the skate fishery, with an average revenue of \$0.23M/year from 2010-2018 (7th highest of all ports), 1.3% of total revenue in Montauk during that time (Table 34). This revenue has been primarily from skate wings (Table 39). Skate fishing engagement and reliance indices on average in 2014-2018 were both high (Table 33), and engagement has been high since 2004 (Table 36).

Table 47. Top five species landed by value in Montauk NY, calendar year 2019.

Species	Nominal revenue (\$)	Vessels	Dealers
Loligo squid	\$4.5M	30	19
Tilefish	\$3.2M	16	12
Scup	\$2.4M	76	18
Summer flounder	\$2.0M	68	23
Silver hake	\$1.1M	31	16

5.6.4.3.4 New Jersey Ports

Belford

General: Belford is a fishing community in Monmouth County, New Jersey. In 2017, Belford had an estimated population of 1,743, a 20% increase from the year 2010 (1,396). In 2017, 0% of the civilian employed population aged 16 years and over worked in agriculture, forestry, fishing, hunting, and mining occupations in Belford; the poverty rate was 2.2%; and the population was 84% white, non-Hispanic.

The commercial fishing engagement and reliance indices for Belford in 2016 were both low. In 2019, Belford was the homeport and primary landing port for 15 Federal fishing permits (i.e., vessels), respectively. Total landings in Belford were valued at \$1.9M, 1% of the state-wide total (\$179M), and were landed by 19 vessels sold to three dealers (specific species are confidential).

Skate fishery: Belford is a primary port for the skate fishery, with an average revenue of under \$0.1M/year from 2010-2018 (>14th highest of all ports, Table 34). Skate fishing engagement and reliance indices on average in 2014-2018 were both high (Table 33). Skate fishery engagement was medium-high in 2004-2013 and has been high since 2014 (Table 36).

Barnegat Light/LongBeach

General: Barnegat Light on Long Beach island is a fishing community in Ocean County, NJ. In 2017, Barnegat Light had an estimated population of 494, a 14% decrease from the year 2010 (574). In 2017, 5% of the civilian employed population aged 16 years and over worked in agriculture, forestry, fishing, hunting, and mining occupations in Barnegat Light; the poverty rate was 1%; and the population was 98% white, non-Hispanic.

The commercial fishing engagement and reliance indices for Barnegat Light in 2016 were both high. In 2019, Barnegat Light was the homeport and primary landing port for 65 and 69 Federal fishing permits (i.e., vessels), respectively. Total landings in Barnegat Light were valued at \$25M, 14% of the state-wide total (\$179M), landed by 55 vessels sold to 13 dealers. Sea scallops (\$20M) was the highest valued species, accounting for 80% of the total Barnegat Light revenue, landed by 25 vessels and sold to 4 dealers (Table 48).

Skate fishery: Barnegat Light is a primary port for the skate fishery, with an average revenue of \$0.25M/year from 2010-2018 (6th highest of all ports), 0.9% of total revenue in Barnegat Light during that time (Table 34). This revenue has been primarily from skate wings (Table 39). Skate fishing engagement and reliance indices on average in 2014-2018 were both high (Table 33), and engagement has been high since 2004 (Table 36).

Table 48. Top five species landed by value in Barnegat Light/Long Beach, calendar year 2019.

Species	Revenue (\$)	Vessels	Dealers
Sea scallop	\$20M	25	4
Monkfish	\$0.96M	41	7
Summer flounder	\$0.49M	18	4

Note: Data are preliminary; data for two of the five top species landed are confidential.

Cape May, New Jersey

General: Cape May is a fishing community in Cape May County, NJ. In 2017, Cape May had an estimated population of 3,500, a 3% decrease from the year 2010 (3,607). In 2017, 0.3% of the civilian employed population aged 16 years and over worked in agriculture, forestry, fishing, hunting, and mining occupations in Cape May; the poverty rate was 9%; and the population was 79% white, non-Hispanic and 15% Hispanic or Latino.

The commercial fishing engagement and reliance indices for Cape May in 2016 were both high. In 2019, Cape May was the homeport and primary landing port for 133 and 138 Federal fishing permits (i.e., vessels), respectively (GARFO 2019). Total landings in Cape May were valued at \$82M, 46% of the state-wide total (\$179M), and were landed by 181 vessels sold to 22 dealers. Sea scallops (\$58M) was the highest valued species, accounting for 71% of the total Cape May revenue, landed by 140 vessels and sold to 11 dealers (Table 49).

Skate fishery: Cape May is a primary port for the skate fishery, with an average revenue of under \$0.1M/year from 2010-2018 (> 14th highest of all ports), >0.01% of total revenue in Cape May during that time (Table 34). Skate fishing engagement and reliance indices on average in 2014-2018 were both high (Table 33), and engagement has been high since 2004 (Table 36).

Table 49. Top five species landed by value in Cape May, calendar year 2019.

Species	Revenue (\$)	Vessels	Dealers
Sea scallop	\$58M	140	11
Inshore longfin squid	\$9.2M	15	3
Loligo squid	\$5.3M	36	7

Note: Data are preliminary; data for two of the five top species landed are confidential.
