# Monkfish Assessment Update 2019

NEFMC SSC  
August 21, 2019

# Terms of Reference (TOR)

- TOR 1: Update fishery-dependent and independent data
- TOR 2: Prepare an approach to providing scientific advice in absence of model
- TOR 3: Update BRPs
- TOR 4: Describe stock status/indicators
- TOR 5: Provide short-term projections
- TOR 6: Comment on research/data improvements for future assessments

# TOR 1. Survey indices - recruitment

North

South

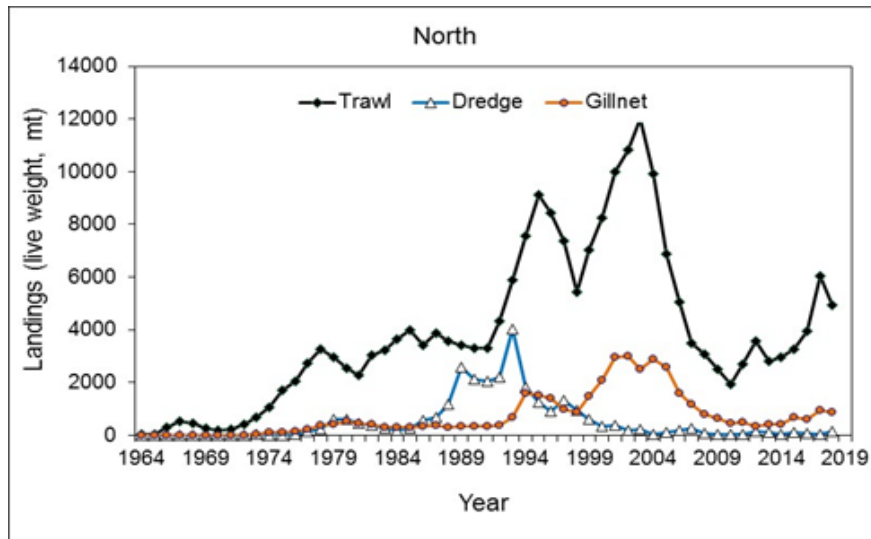

# TOR 1: Update data

- Commercial landings

# TOR 1. Update data – landings by gear

- North landings – trawls

- South landings – gillnets

# TOR 1. Update data – discards

- By gear type
- Significant discarding of 2015 YC, especially dredge

# TOR 1. Update data - discards

- Significant discarding of 2015 YC
- $D/(D+K)$  2016-2018:
- North 18%

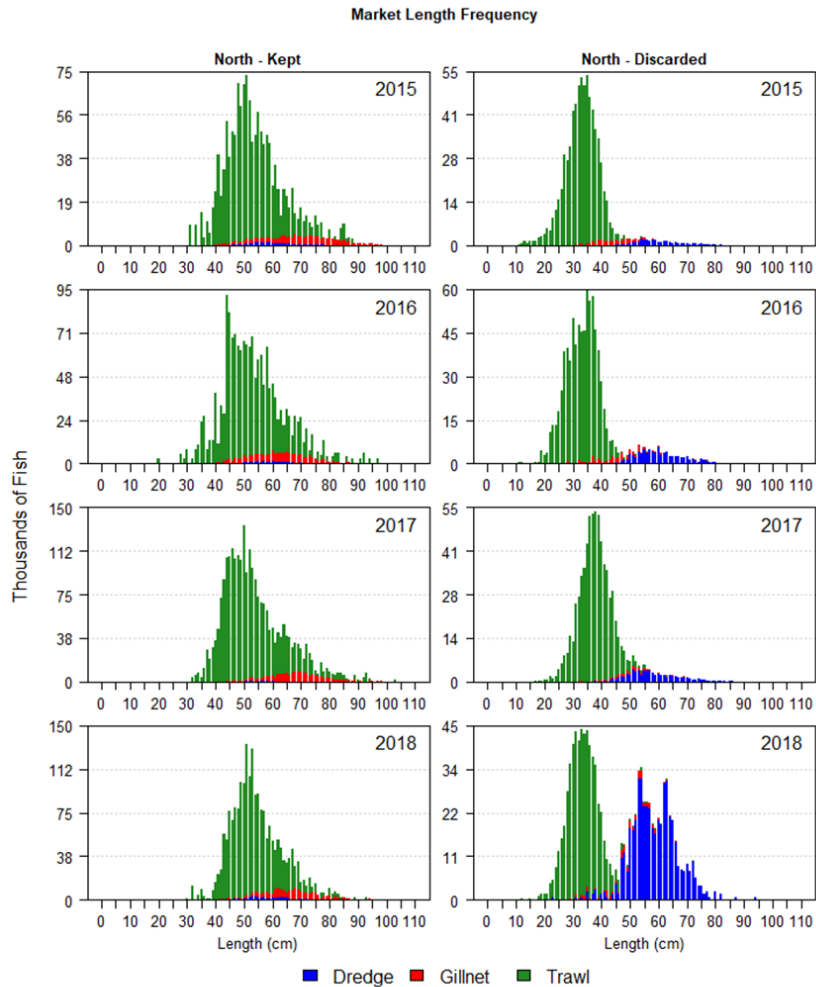

South 51%

# TOR 1. Catch length composition - North

Kept

Discarded

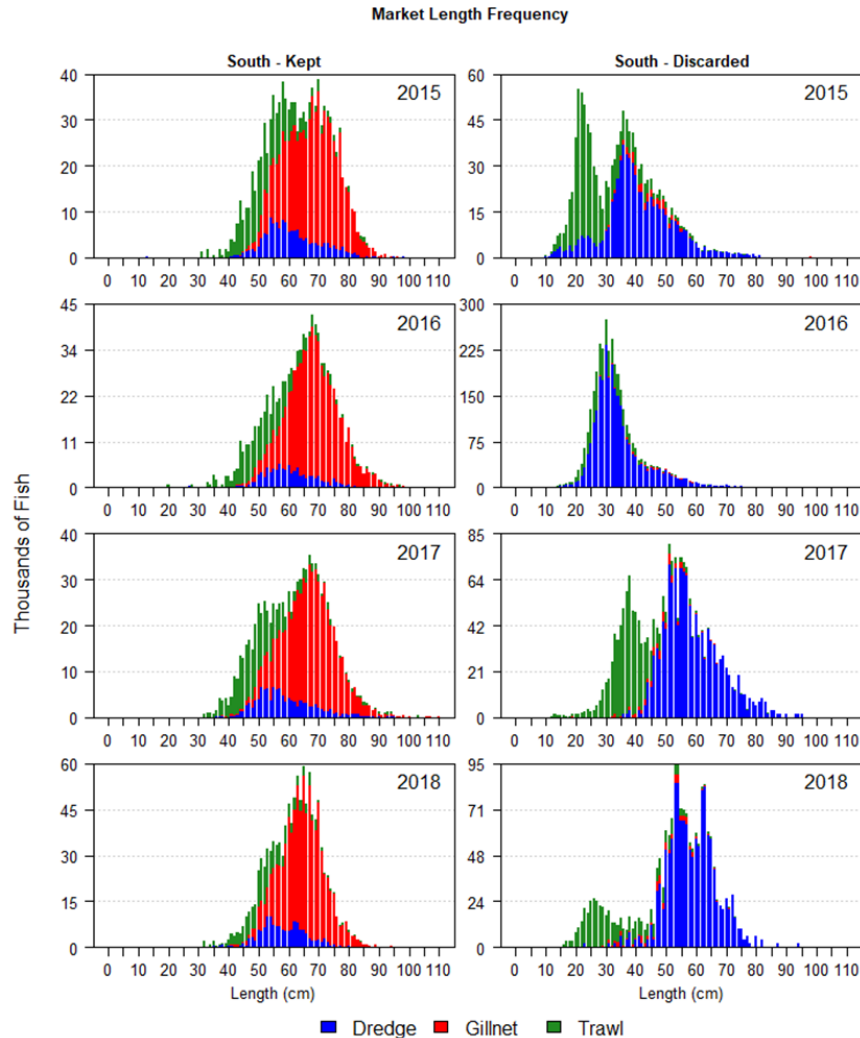

# TOR 1. Catch length composition - South

Kept

Discarded

# TOR 1. Survey indices - North

- FSV Bigelow series

Biomass

Abundance

# TOR 1. Survey indices - South

- FSV Bigelow series

# TOR 1. Exploitable stock indices - 43+ cm

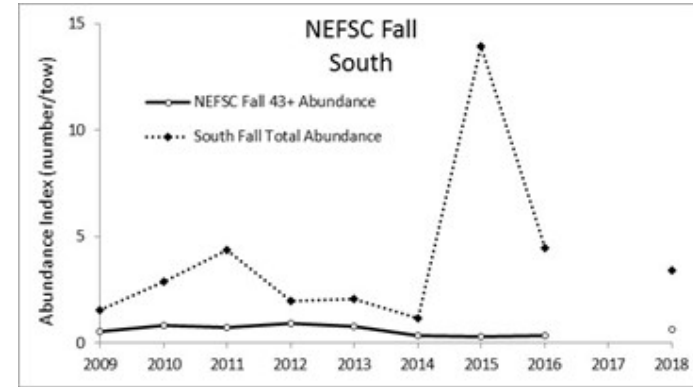

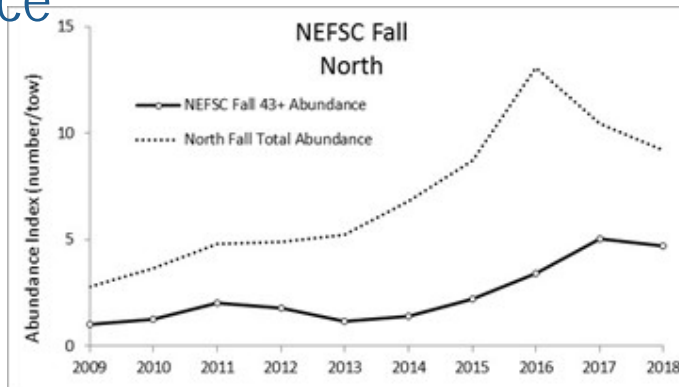

## North-fall

## South-fall

Biomass

Abundance

# TOR 3. Scientific advice in absence of model

- North

# TOR 3. Scientific advice in absence of model

- South

- Missing index for fall 2017; fall 2016 and 2018 averaged

## TOR 4. Qualitative descriptions of stock status

- Status improving (North) or steady (South) past 3 yr
- 2015 recruitment event major influence
  - Biomass increasing due to individual growth in 2015 YC, but 2015 YC abundance declining
  - 2015 YC now in exploitable size range
  - Recruitment indices have returned to average levels
  - Patterns of change in biomass may be influenced by movement between management areas

# Percent Change Estimates

		2016 assessment		2019 assessment update					
		Spring+Fall	Fall only	Spring+Fall	Fall only				
North	Total B			1.22	1.26	fall lagged so terminal point is avg of fall 2018 and spring 2018			
	Exploitable B					fall lagged so terminal point is avg of fall 2018 and spring 2019			
	Exploitable B	1.06	1.02	1.38	1.34	fall not lagged so terminal point is avg of fall and spring 2018			
	Total Abundance			1.03	0.94	fall lagged so terminal point is avg of fall 2018 and spring 2018			
South*	Total B			1.04	0.96	fall lagged so terminal point is avg of fall 2018 and spring 2018			
	Exploitable B					fall lagged so terminal point is avg of fall 2018 and spring 2019			
	Exploitable B	0.87	0.80	1.58	1.42	fall not lagged so terminal point is avg of fall and spring 2018			
	Total Abundance			0.73	0.51				
*2016-2018 averaged to interpolate for missing 2017 fall index in south									

# TOR 6. Research areas / data issues

- Age and growth
- Stock structure and movements
- Cannibalism?

# A&G research

- 2015 YC
  - Sampled over time within size mode
  - Aged 'known' age fish using verts and illicia
  - 0% agreement with 'known' age, all ages overestimated
  - Current work: hardpart microconstituents, correlate (or not) with optical zonation (Secor lab, U MD, CBL)

- 2015 YC

## TOR 3. Scientific advice for management: “Plan B”

- Used for GB cod 2015 and monkfish 2016; updated version used in 2019 (PlanBSmooth.R)
  - Average NEFSC fall and spring surveys, total biomass
  - Smooth indices (Loess,  $\alpha=0.30$ )
  - Log-linear regression to estimate slope over last 3 years
  - Percent change =  $\exp(\text{slope})$
  - Apply percent change to average catch for previous 3 years to estimate new TAC
